CREATING IDEAS &
DRIVING INNOVATIONS

Study on CNOSSOS-EU final report

Author: Olaf Uszynski, Carolin Schliephake

Agenda

- **Project plan**
- **Work Package 1 → Literature review**
  - WP 1.1: Analysis of current source description models (END & CNOSSOS-EU)
  - WP 1.2: Evaluation of noise mapping & management actions
- **Work Package 2 → Elaboration of correction factors**
  - WP 2.1: Analysis of existing source description methods
  - WP 2.2: Determination of source description accuracy
  - WP 2.3: Suitable adaptations of the source description
- **Summary**
- **Outlook**

Analysis of current source description models
Key questions/ tasks within work package 1.1

1. **Elaboration of a high-level description of the CNOSSOS-EU model**
   - » Derivation of the relevant model parameters and data sets for further project WPs

2. **Development of an overview on road traffic noise source description models**
   - » Determination of suitable models for comparison

3. **Overview on underlying data of the CNOSSOS-EU model**

© fka GmbH

High-level description of CNOSSOS-EU
Background: Environmental noise directive (END) 2002/49/EC

- **Environmental noise directive (END) 2002/49/EC**
  - Strategic noise maps every 5 years since 2007, including roads traffic, railway, aircraft & industry
  - The aim is to use a common model
    - Outcome of 1st strategic noise maps: Significant deviation between models and no comparability given

- **Consistent source description is needed**
  - States have developed own models for noise mapping (and therefore source descriptions) in the past (see overview on **slide 16**)

- **Goal: Common model for member states for noise mapping**

CNOSSOS-EU vehicle sound source description [EUR15]

» Noise emission as a function of vehicle speed and frequency (equation based)

» Rolling noise $L_{WR} = A_R + B_R \cdot \log\left(\frac{v}{v_{ref}}\right) + \Delta L_{WR}$

» Propulsion noise $L_{WP} = A_P + B_P \cdot \frac{v - v_{ref}}{v_{ref}} + \Delta L_{WP}$

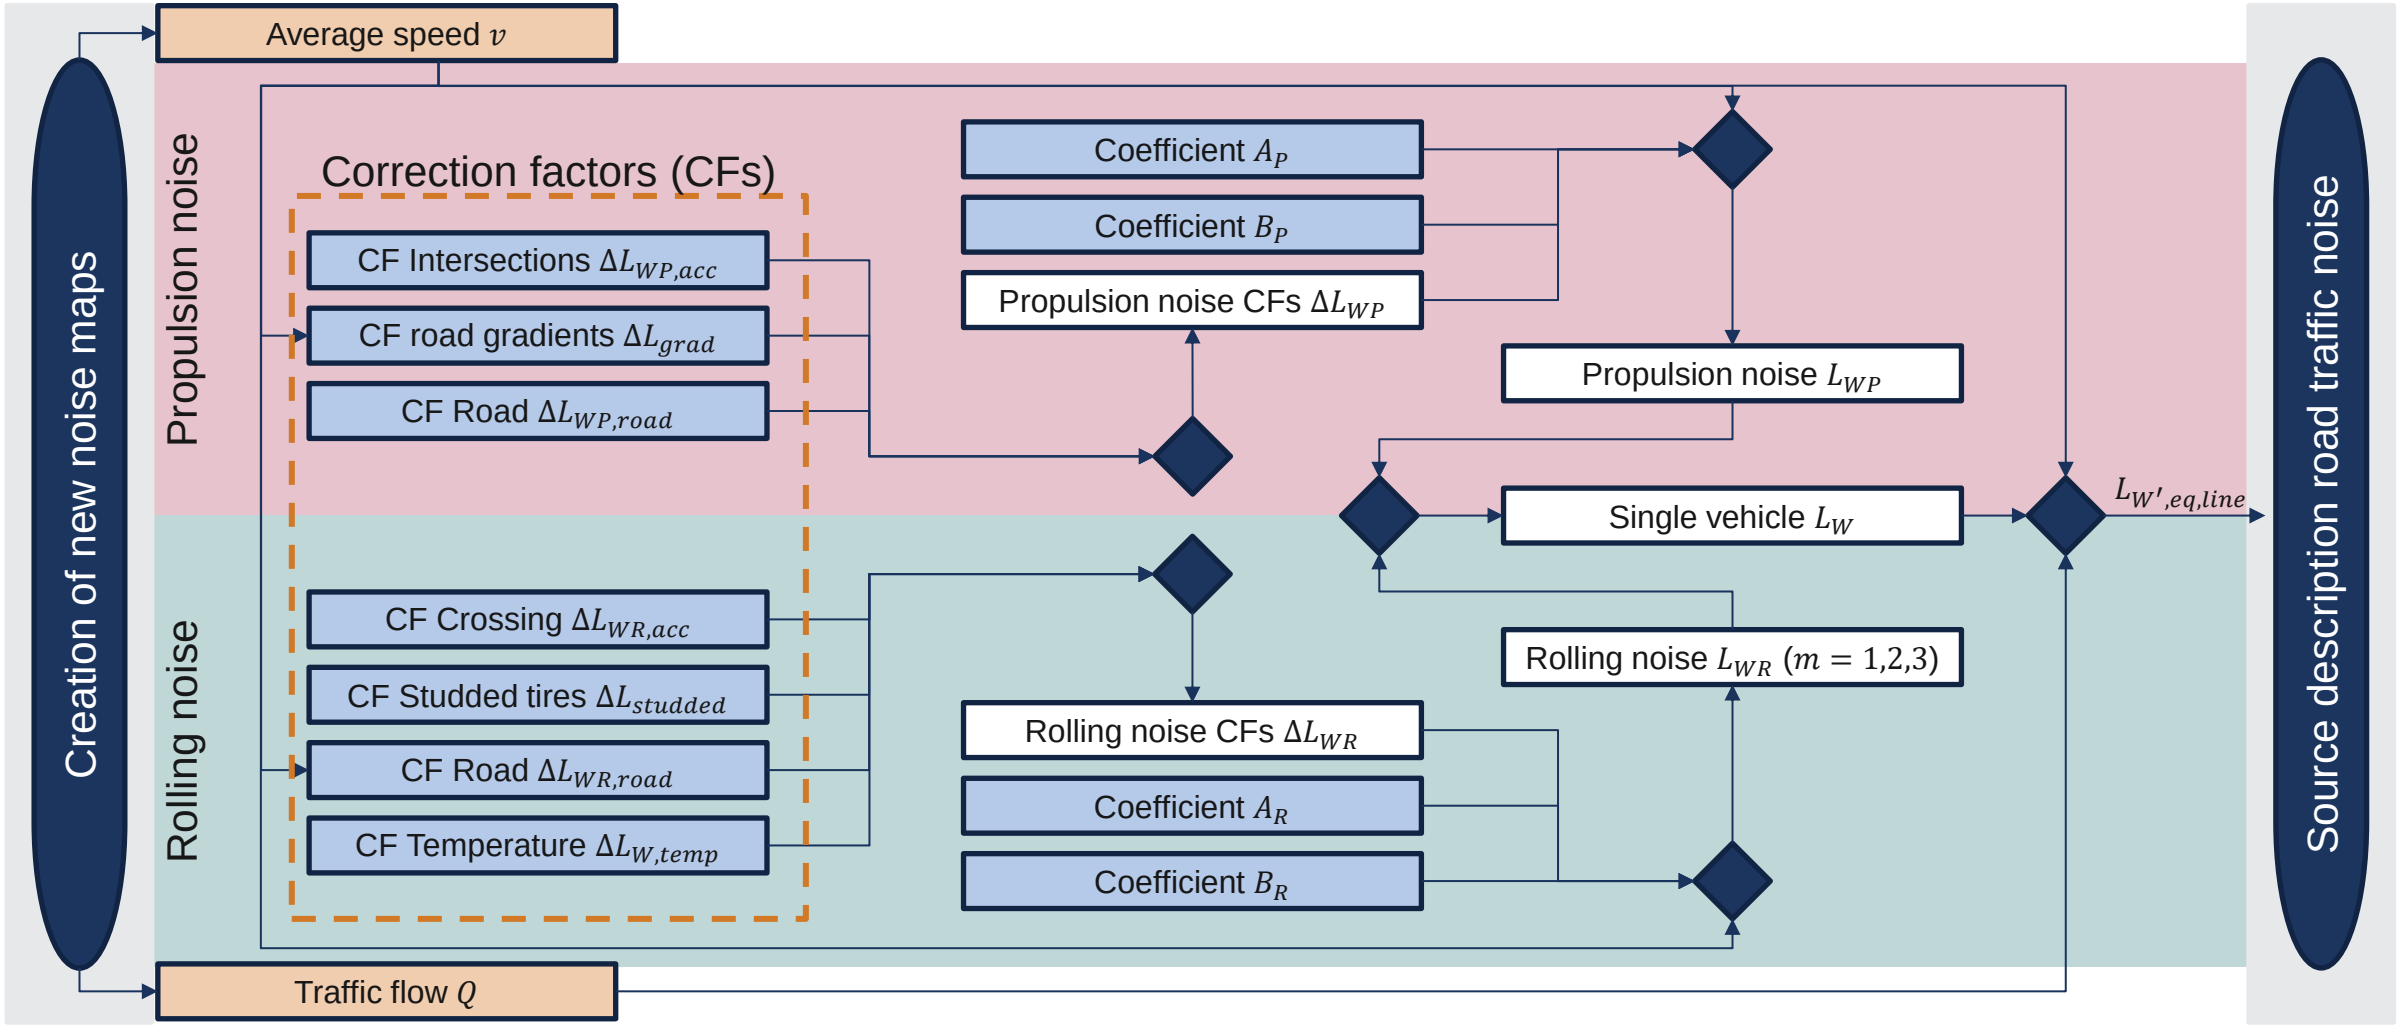
» Overall sound level $L_W = 10 \cdot \log(10^{0.1 L_{WR}} + 10^{0.1 L_{WP}})$

» $v_{ref} = 70$ kph

» Correction factors

© fka GmbH

High-level description of CNOSSOS-EU
Flow chart



Note: For reasons of clarity, the dependence on frequency (octave band) and vehicle category is not shown

© fka GmbH

High-level description of CNOSSOS-EU

Overview of road traffic noise models

- **Until a common method was implemented, EU member states have used their own models**
- **Overview of national/ regional models are shown below**

#	Name	Year	Area of application
1	CNOSSOS-EU	2015	EU
2	HARMONOISE/IMAGINE	2003/2006	EU

European attempts to achieve the goal of common models for noise mapping → This projects objectives

HARMONOISE

- Goal: Development of a suitable candidate for common noise mapping modeling
- Approach: common road traffic noise source model for average European road vehicles
- Result: New and significantly more complex model

IMAGINE

- Goal: Further development of HARMONOISE model with the aim to:
  1. Include industrial and aircraft noise
  2. Extend the source databases for road traffic noise

CNOSSOS-EU

- Goal: Establishment of Common Noise aSSessment methOdS (CNOSSOS-EU)

[ABB02] [ECO12] [KEP12] [EU15] [IMA07] [ZHA14]

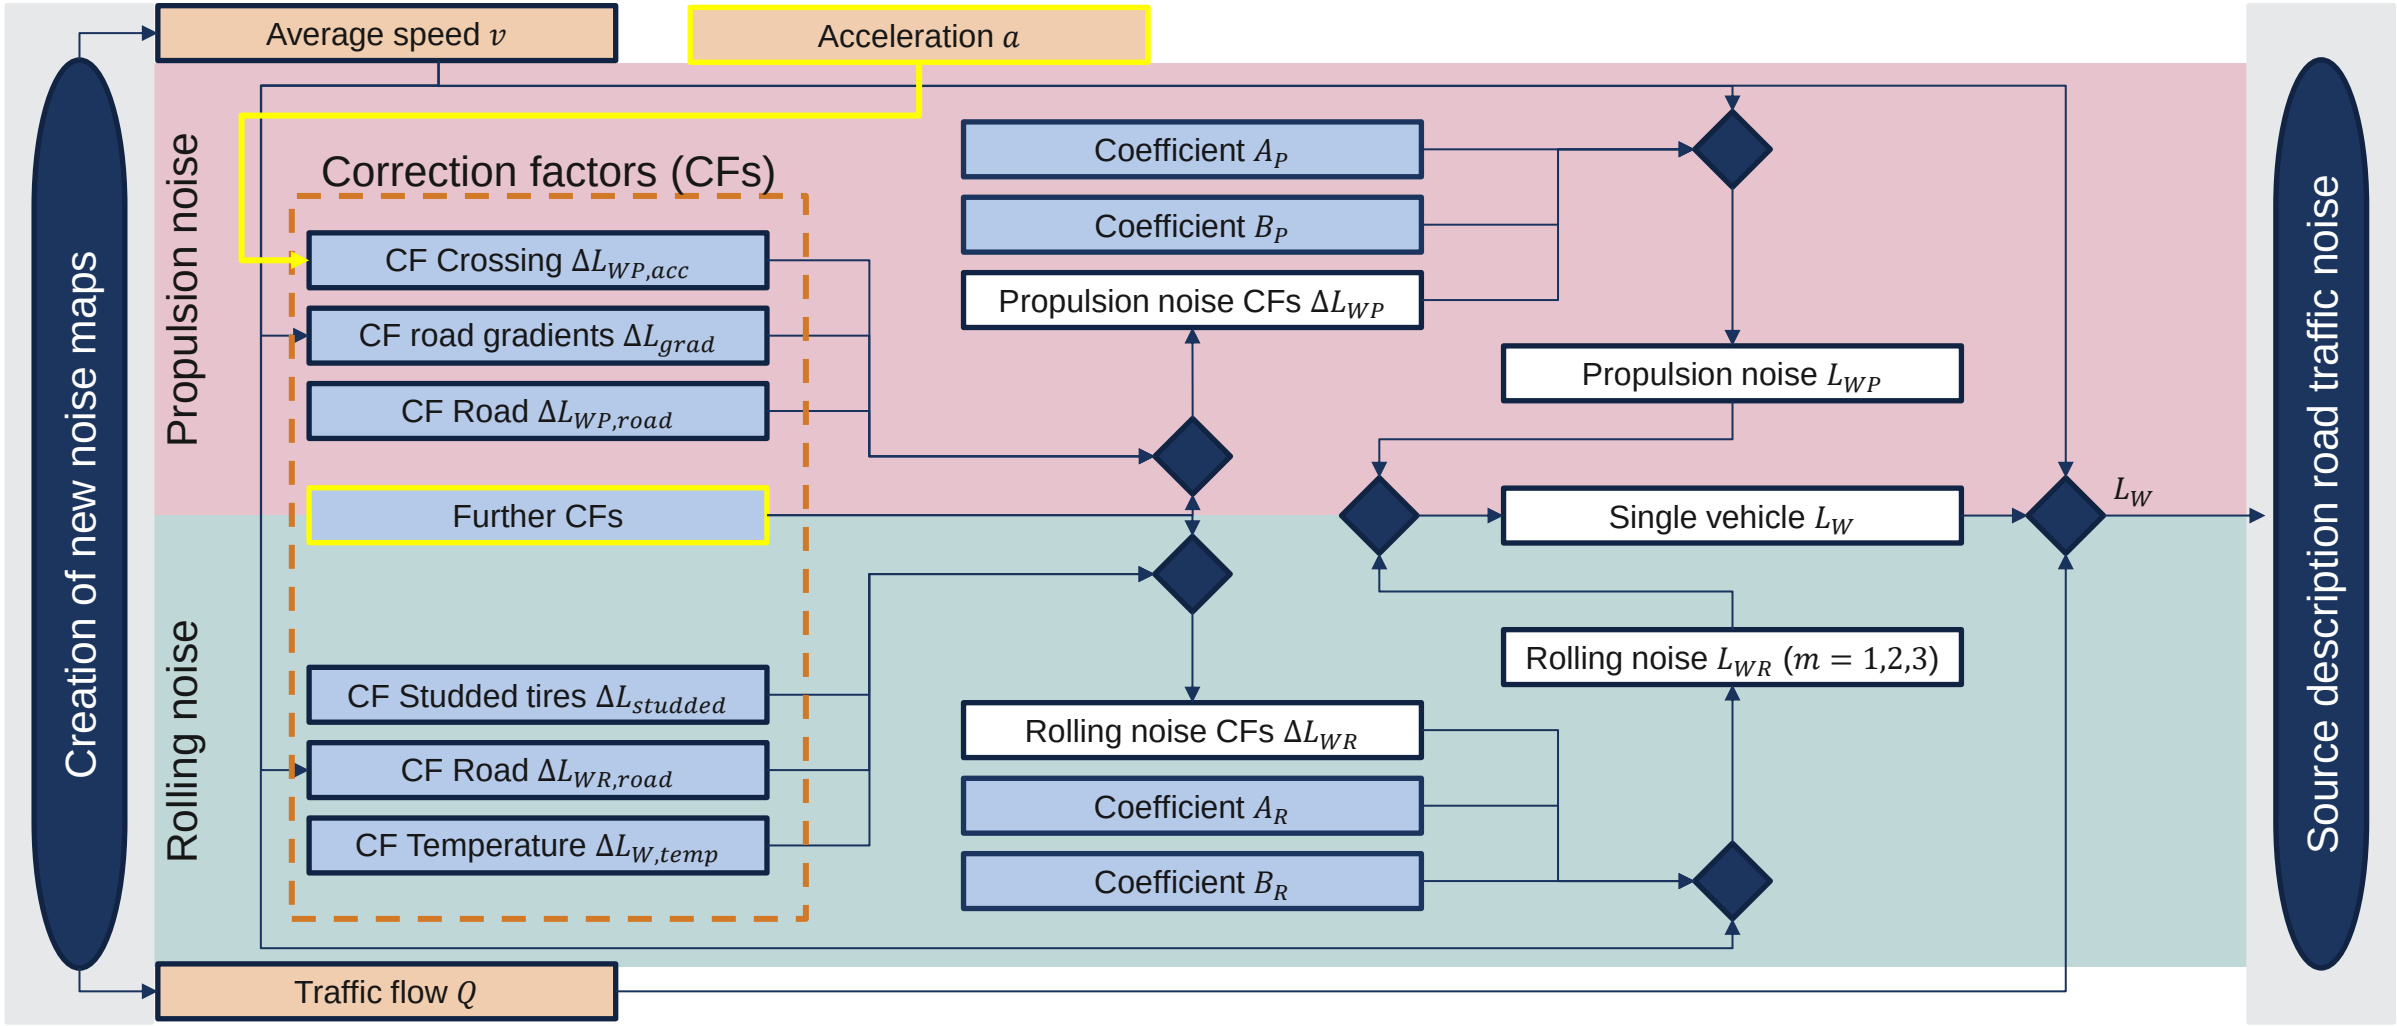
Flowchart for HARMONOISE/IMAGINE

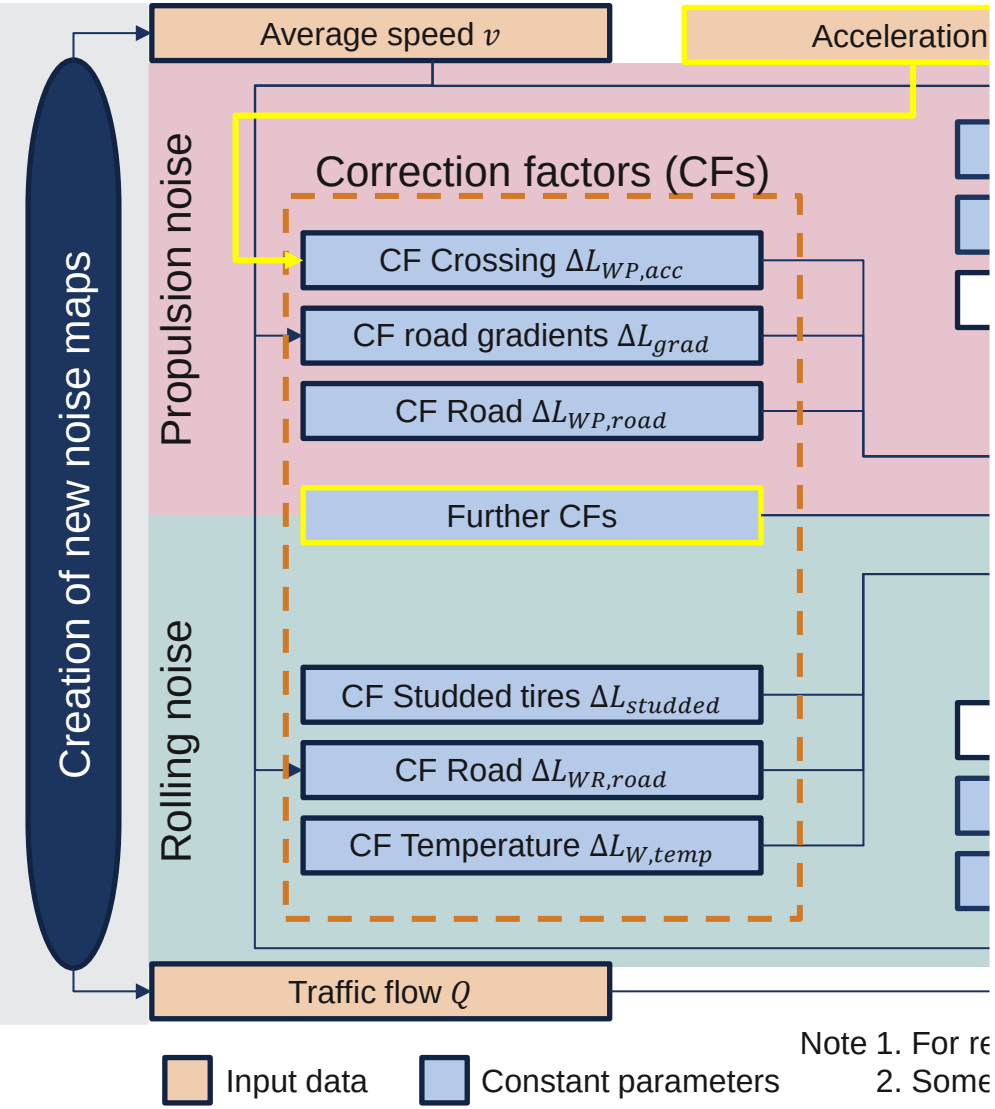


Input data Constant parameters

Note 1. For reasons of clarity, the dependence on frequency (1/3-octave band) and vehicle category is not shown
2. Some calculations & correction values change. Only the relation of similar values & parameters is depicted

© fka GmbH

Overview of road traffic noise models
Flowchart for HARMONOISE/IMAGINE



Main differences

The source description models are similar, however:

1. Acceleration is a further input in HARMONOISE/ IMAGINE
2. No 5th open vehicle category in HARMONOISE/ IMAGINE
3. Different source locations/ height
4. Additional correction factors (CFs) are taken into account in HARMONOISE/ IMAGINE, e.g.:
   - » Number of axles (HDV)
   - » Directivity of sources
   - » Further regional differences
   - » Diesel/gasoline
   - » Average vehicle weight & age
   - » Tire width & type (winter/summer)
   - » Illegal silencer systems

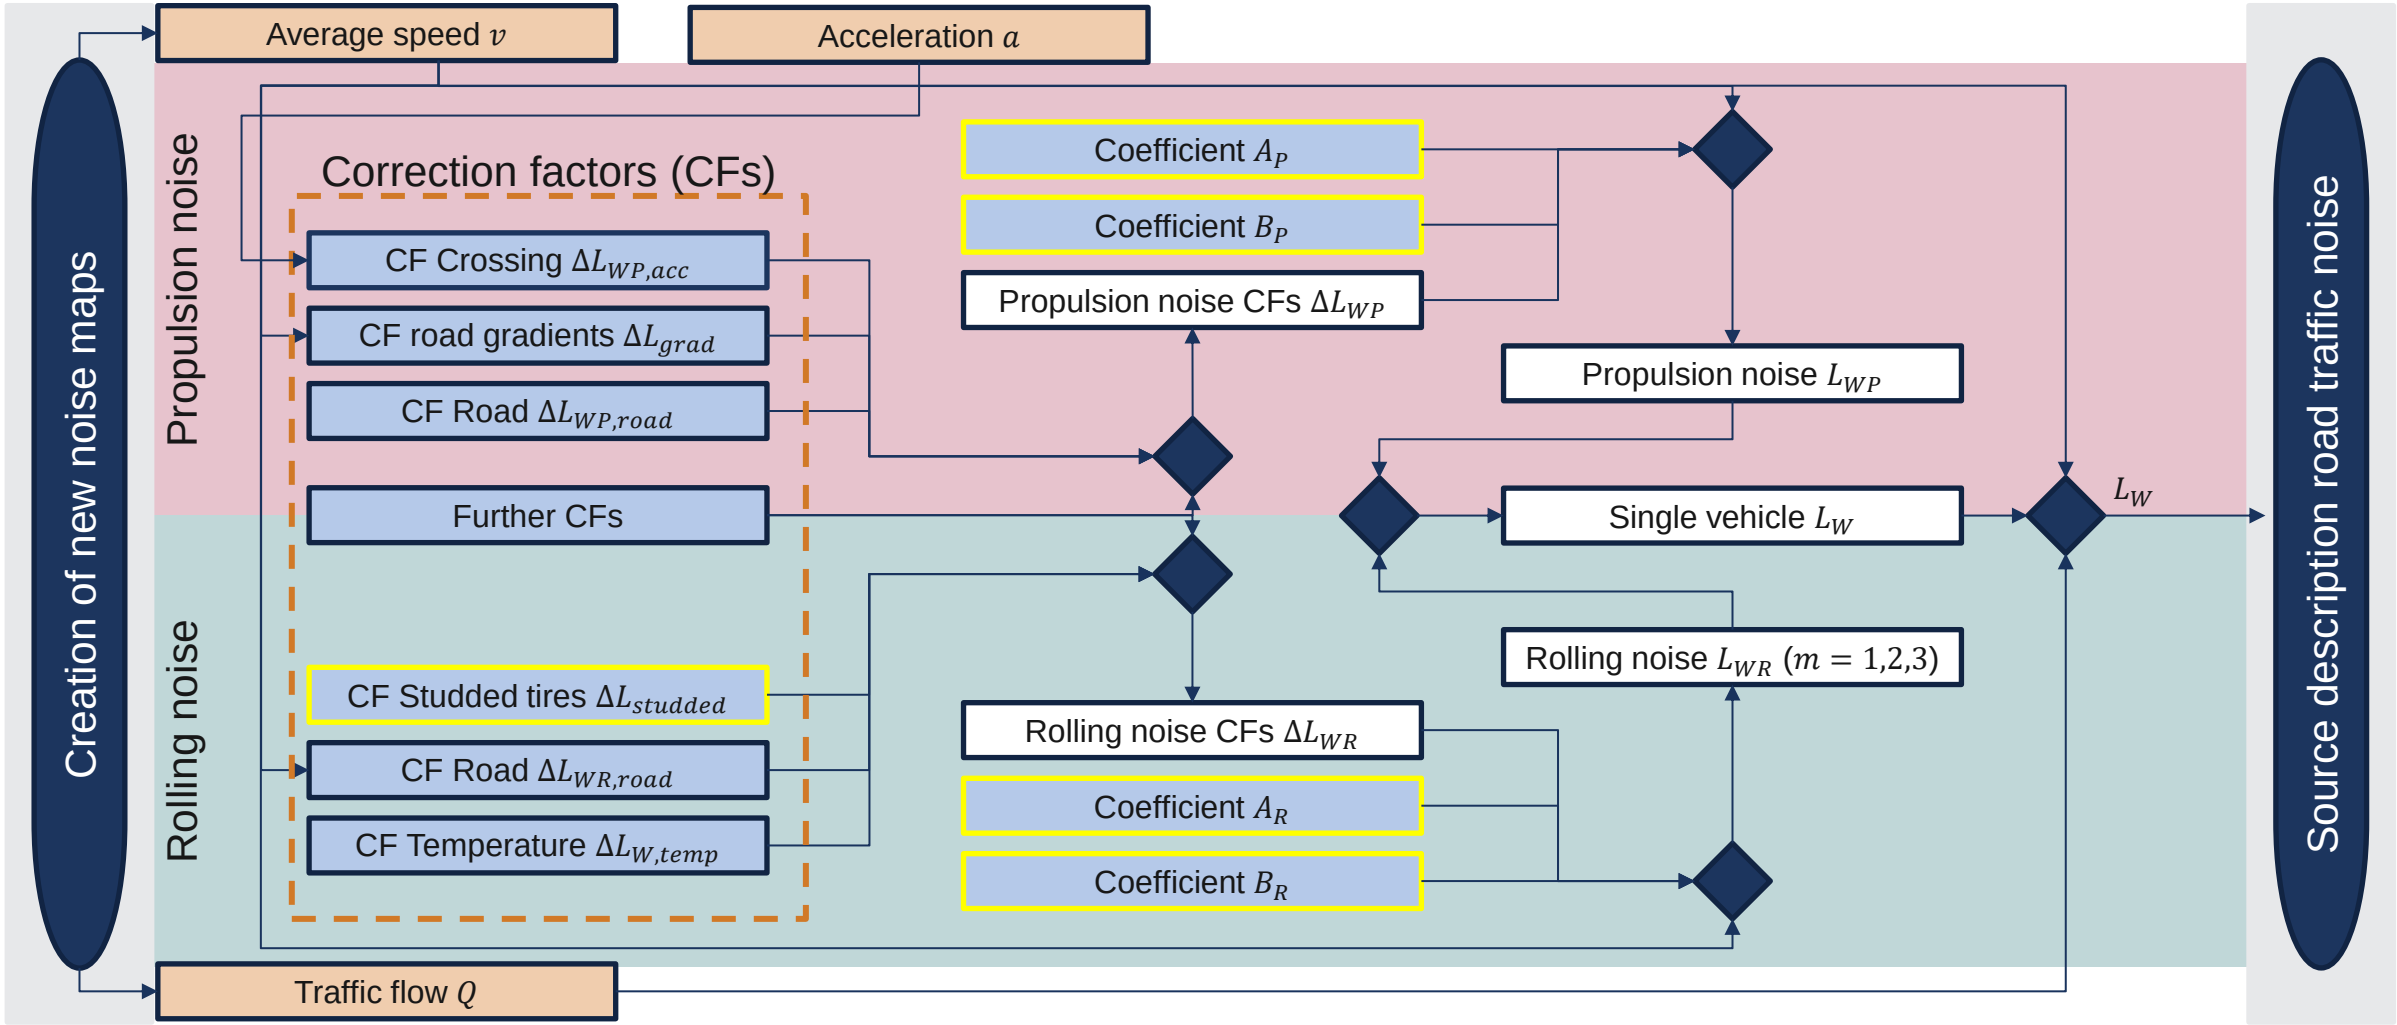
Source description models for traffic noise
Nord2000 – Flow chart

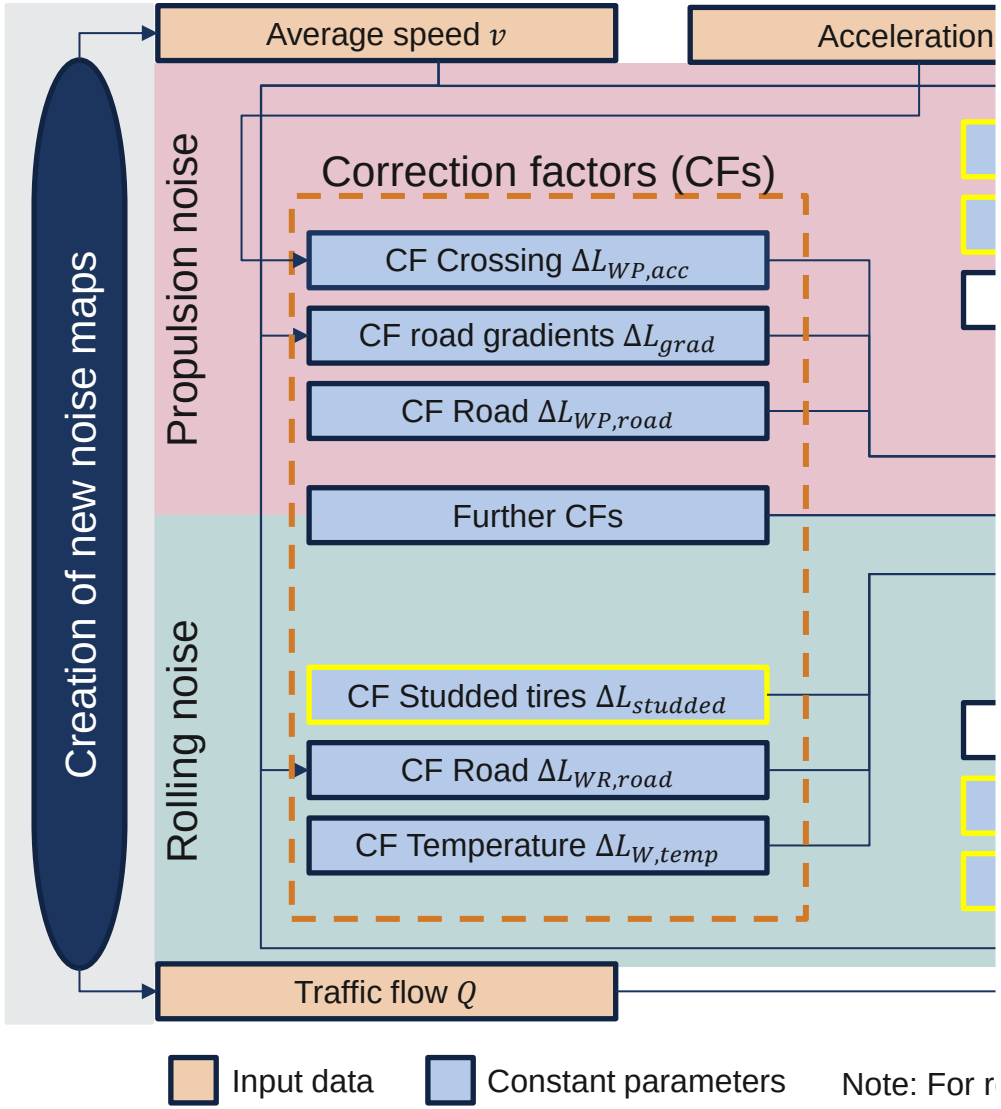


Input data Constant parameters

Note: For reasons of clarity, the dependence on frequency (1/3-octave band) and vehicle category is not shown

© fka GmbH

Source description models for traffic noise
Nord2000 – Flow chart



Main differences

The source description models HARMONOISE and Nord2000 are very similar, however certain modifications have been made:

1. Regional corrections to A_R
2. Corrections to speed coefficients B_P and B_R and to A_P
3. Corrections for studded tires are modified
4. Horizontal directivity of rolling noise is modified

© fka GmbH

Overview of road traffic noise models
Reference conditions for CNOSSOS-EU & HARMONOISE/IMAGINE

CNOSSOS-EU

- Constant vehicle speed
- Reference vehicle speed v_{ref} = 70 kph
- A flat road (non-sloped)
- Air temperature 20 °C
- Road surface
  - Mixture of DAC 0/11 & SMA 0/11
  - ≥ 2 years & < 7 years
  - Dry
  - Sound reflecting
- No studded tires
- Vehicle fleet representing European average, e.g. Category 1: 187mm tire width, 19% diesel, 10.5% delivery vans, no studded tires

=

HARMONOISE/IMAGINE

- Constant vehicle speed
- Reference vehicle speed v_{ref} = 70 kph
- A flat road (non-sloped)
- Air temperature 20 °C
- Road surface
  - Mixture of DAC 0/11 & SMA 0/11
  - ≥ 2 years (not at life time end [IMA07])
  - Dry
  - Sound reflecting
- No studded tires
- Vehicle fleet representing European average, e.g. Category 1: 187mm tire width, 19% diesel, 10.5% delivery vans, no studded tires

© fka GmbH

Overview of road traffic noise models
Reference conditions for CNOSSOS-EU & HARMONOISE/IMAGINE

CNOSSOS-EU

- Constant vehicle speed
- Reference vehicle speed v_{ref} = 70 kph
- A flat road (non-sloped)
- Air temperature 20 °C
- Road surface
  - Mixture of DAC 0/11 & SMA 0/11
  - ≥ 2 years & < 7 years
  - Dry
  - Sound reflecting
- No studded tires
- Vehicle fleet representing European average, e.g. Category 1: 187mm tire width, 19% diesel, 10.5% delivery vans, no studded tires

=

Nord2000

- Constant vehicle speed
- Reference vehicle speed v_{ref} = 70 kph
- A flat road (non-sloped)
- Air temperature 20 °C
- Road surface
  - Mixture of DAC 0/11 & SMA 0/11
  - ≥ 2 years (not at life time end [JON06])
  - Dry
  - Sound reflecting
- No studded tires
- By using new Nordic data, regional differences in vehicle fleet, road surfaces and studded tires are accounted for

Overview on underlying data sets
IMAGINE – Introduction

- **Several measurement campaigns have been conducted**
  - Within IMAGINE
  - From further projects/models (e.g. Nord2000 (2006) [DEV])

- **Differentiation between rolling noise and propulsion noise**
  - Test drives using on-board measurement equipment
  - Pass-by measurements on test tracks
  - Coast-by measurements on test tracks

- **Final adjustment/calibration of sound power level by means of pass-by measurements at roadside in Italy, Denmark, Poland, Netherlands and UK**

- **Detailed information can be found in the project report [IMA07a] and in [PEE18]**

© fka GmbH

Overview on underlying data sets
IMAGINE – Available data

» **Data that was already during IMAGINE available and reanalyzed**

#	Measurement	Provided by	Acquired in
1	Rolling noise levels (15 truck tires, 12 surfaces)	M+P	2003
2	Data on driving conditions of two-wheelers	IMMA	2000
3	Pull-away m. (measurements) HDV	TRL	
4	Coast-by m. of trucks	TRL	
5	Sound emission level of traffic	M+P & TRL (SILVIA project)	2004
6	Controlled Pass-By m.	Autostrade	
7	Rolling noise m. for light motor vehicles & trucks	M+P (for ACEA)	
8	Propulsion noise for light motor vehicles	TUG (VENOM)	
9	NORD2000 data, transfer functions & calculations	SP (Sweden)	

Because the IMAGINE lasted from 2003 to 2006 and this data was already available during the project, this data can only be from 2005/2006 or earlier

© fka GmbH

Overview on underlying data sets
IMAGINE – Data acquisition

» **Data that was acquired during IMAGINE in WP5 (1/2)**

#	Measurement	Conducted by	Acquired in
1	On-board m. of Powered Two-Wheelers	M+P	2004
2	Propulsion noise laboratory m. of HDVs	Volvo	2005
3	Outdoor noise m. of HDV at test track/roundabout	Volvo / SP	2005
4	Pass-by m. at UK highway	TRL	2005
5	Pass-by m. in Nordic countries	SP	2005
6	Pass-by m. in Poland	TUG	2005
7	Pass-by m. in Poland	TUG / M+P	2006
8	Pass-by m. in Italy	M+P	2006

“Separate reports have been written for some of these campaigns” [IMA07a]

#	Measurement	Conducted by	Acquired in
9	Pass-by m. on several locations in NL	M+P	200**6**
10	Pass-by m. on scooters, motorcycles in Italy	JRC / Autostrade	200**5**
11	Pass-by m. on powered two-wheelers GR (Mykonos)	JRC / TUG	200**6**
12	Pass-by m. of trucks at low velocities	M+P	200**6**
13	Pass-by m. of Powered two-wheelers	M+P	200**5**
14	Pass-by m. of accelerating traffic	M+P	200**5**
15	Stop and go m. at Italian motorway toll station	Autostrade	200**6**
16	Statistical data gathering	M+P, TRL, JRC	200**4** - 200**6**

“Separate reports have been written for some of these campaigns” [IMA07a]

The following slides (33-47) are only intended to show different measuring methods exemplarily

© fka GmbH

Overview on underlying data sets
IMAGINE – Data acquisition – Category 1 – Rolling noise

Information on measurement campaigns

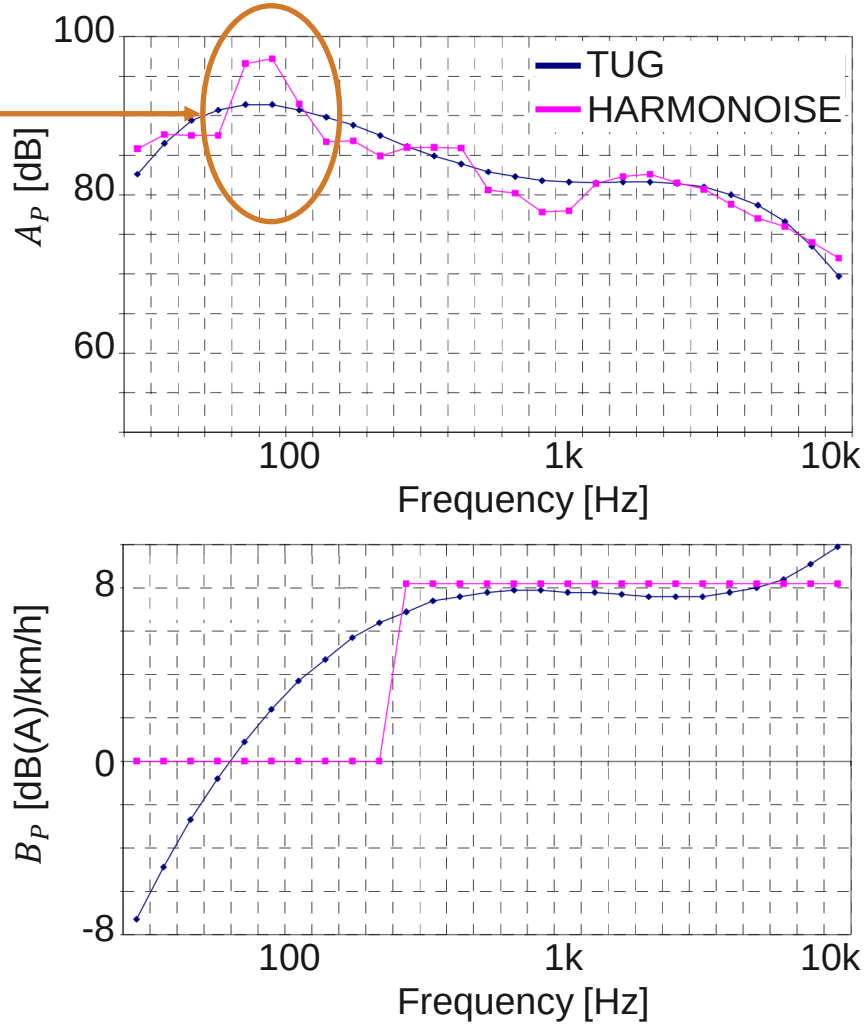
- M+P and Müller-BBM conducted measurements in 1997-2001 for the German Federal Highway Research Institute (BASt) in order to derive a rolling noise emission model [BEC01]:
  - 42 different road surfaces on a test track in Sperenberg (DE)
  - 2 different vehicles
  - 8 tires for each vehicle (& 4 truck tires)
  - Measurements of road parameters (absorption, textures, …)
- The data has been reanalyzed for HARMONOISE/IMAGINE

© fka GmbH

Overview on underlying data sets
IMAGINE – Data acquisition – Category 1 – Propulsion noise

Information on measurement campaigns

- TU Gdansk (TUG) and VTI Sweden developed a model for pass-by noise prediction for category 1 vehicles
  - Based on vehicle speed, acceleration & gear
- TUG coefficients A_P, B_P, C_P derived by analyzing the maximum sound pressure level measured
- The coefficients agree well compared to the default values from HARMONOISE
- NOTE: The coefficients found by TU Gdansk depicted in the graph are smoothed, leading to underestimated levels around 80 Hz
- Detailed information in IMAGINE report IMA05TR-060301-TUG03 (not available publicly)
- No information on year of acquisition

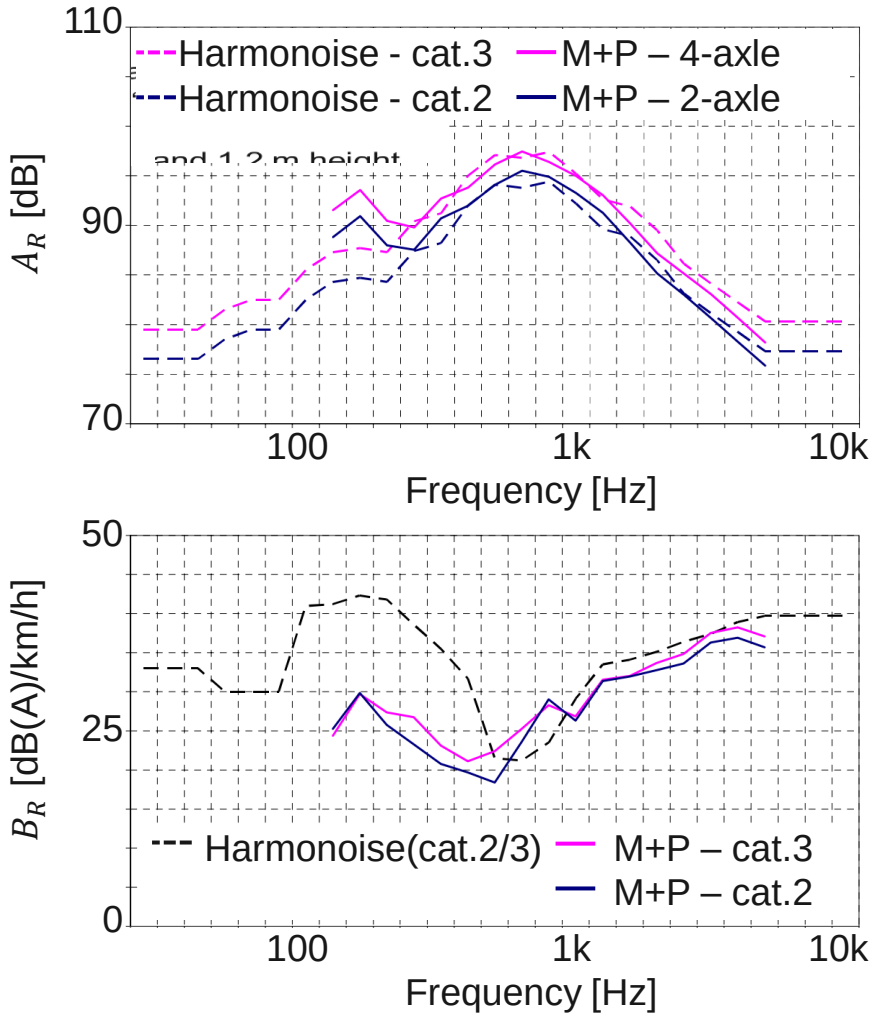


© fka GmbH

Overview on underlying data sets
IMAGINE – Data acquisition – Category 2 & 3 – Rolling noise

Information on measurement campaigns

- M+P conducted pass-by measurements for the Durch Ministry of Transport (“Innovatieprogramma Geluid”):
  - Microphone: 7.5 m aside and 1.2 m height (sound exposure level SEL & L_{max})
  - 15 truck tires
    - Steering (rib profile)
    - Traction (block profile)
    - Trailer (block profile)
    - New and worn conditions
  - 12 surfaces
  - Speed range 45 - 95 km/h
  - A_R & B_R
- No detailed information on interim report number



© fka GmbH

Overview on underlying data sets
IMAGINE – Data acquisition – Category 2 & 3 – Propulsion noise

Information on measurement campaigns

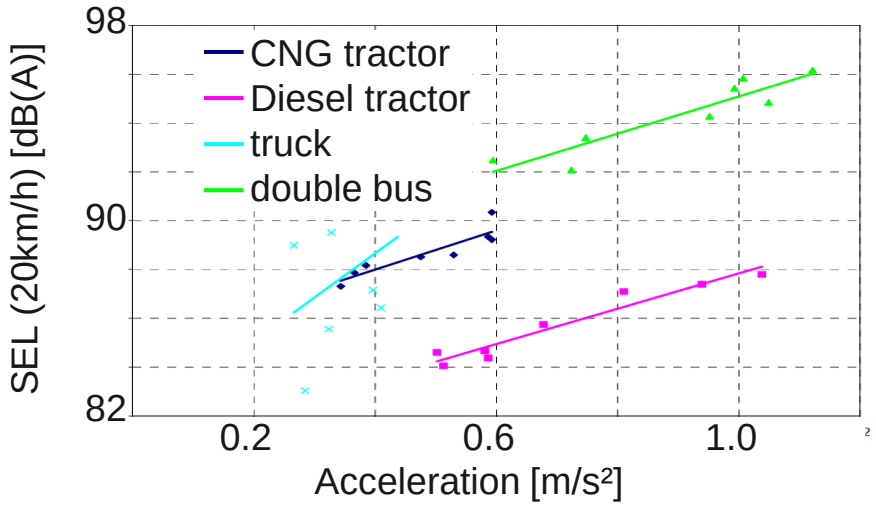
- Conducted by Volvo in 2005:
  - According to ISO 3744 method
    1. Only driveline (upper figure)
    2. Full truck with covered rear wheels on dynamometer (lower figure)
    3. Simulated city cycles
  - Driving conditions for 1. and 2.:
    - For different gears at constant speed
      - Varying: Load, gradient, …
    - Acceleration from 0 – 70 km/h
    - Braking
- Detailed information in IMAGINE report IMA05TR-050618-Volvo01

© fka GmbH

Overview on underlying data sets
IMAGINE – Data acquisition – Category 2 & 3 – Acceleration

Information on measurement campaigns

- Transport Research Laboratory (TRL) in the UK performed acceleration measurements „pull-away“ from stand still
  - In this condition, the rolling noise can be neglected
  - Factor ~8 dB(A) per 1 m/s² for three of the tested vehicles; significant deviations for further vehicles
  - → Overestimation of acceleration dependency
  - → Especially for normal traffic
  - → HARMONOISE assumes 5.6 dB(A) per 1 m/s²
- No detailed information on interim report number

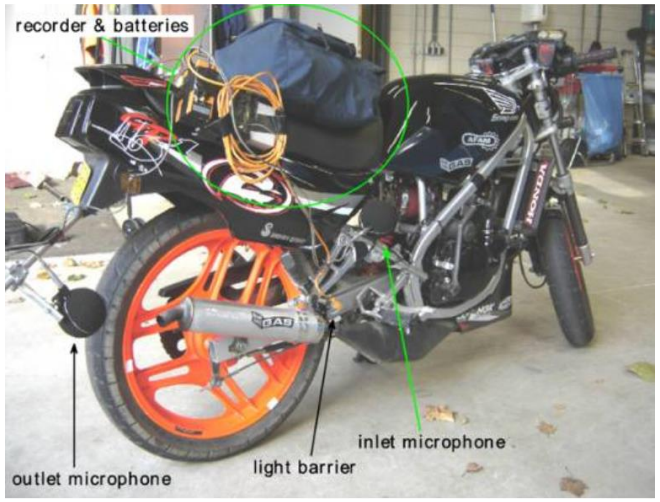


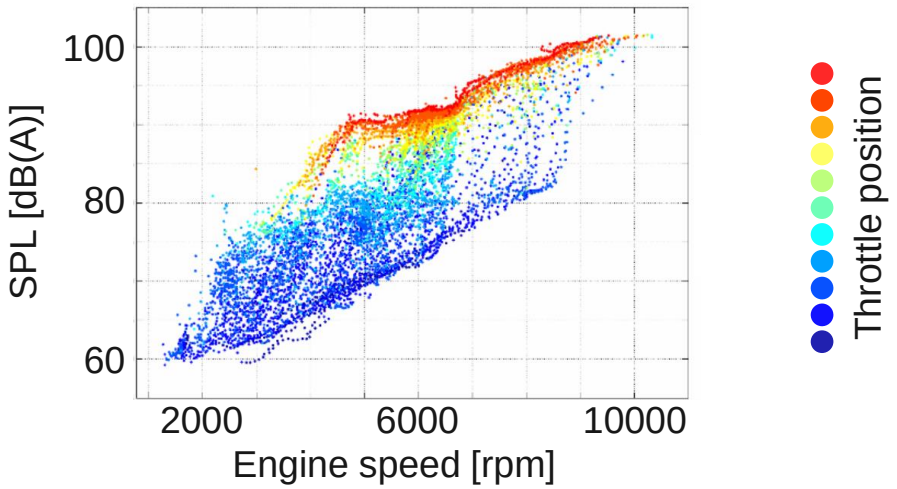
© fka GmbH

Overview on underlying data sets
IMAGINE – Data acquisition – Category 4 – On board city driving

Information on measurement campaigns

- City-driving was conducted by M+P with on board systems on three vehicles
  1. 50 cc scooter with automatic transmission
  2. 80 cc moped with manual transmission
  3. 885 cc motorcycle with 3 cylinders & manual transmission
- Data acquisition
  - Sound pressure at engine intake & exhaust
  - Further quantities: Speed, engine speed & throttle position (→ acceleration)
- Data analysis
  - Coefficients A_p and B_p from averaging the two positions
- No detailed information on interim reports





© fka GmbH

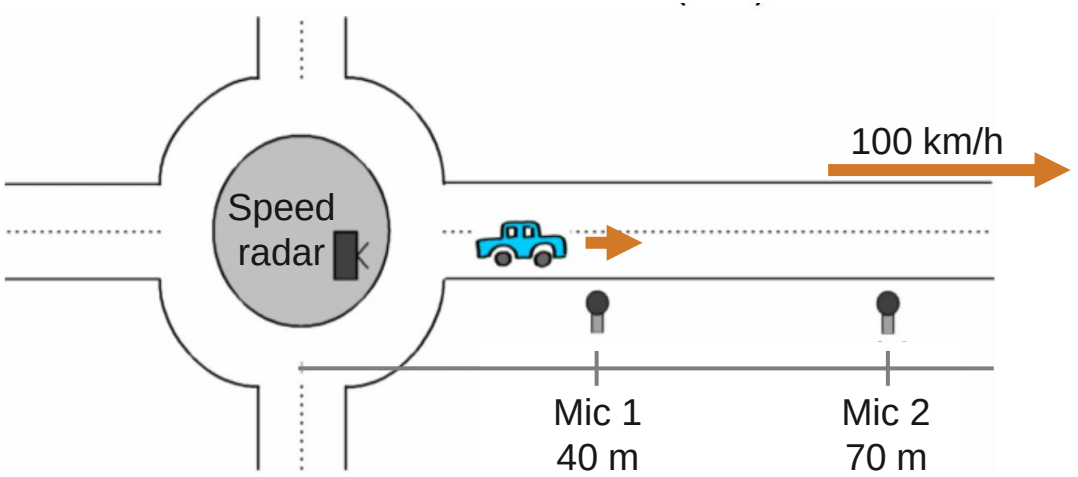
Overview on underlying data sets
IMAGINE – Data acquisition – Road side measurements

Category 4 (powered two-wheelers)

- Conducted by TUG, JRC, M+P & Autostrade
- Places and times with high expected number of cat. 4 vehicles were expected (2005-2006)
  - NL Assen: International motorcycle race
  - NL river Waal: Organized country-side tour
  - GR Mykonos (seen in image below)
  - IT city road

Category 1 (light motor vehicles)

- Conducted by M+P at an intersection
- Investigation of the influence of acceleration on the propulsion noise
- Issue 1: Difference between acceleration & speed
- Issue 2: Difference between rolling & propulsion



© fka GmbH

Overview on underlying data sets
Road side measurements – General information

	SPB-ISO	SPB-HI	SPB-L	U-SPB
Reference	ISO/DIS 11819-1 [10]	HARMONOISE/IMAGINE [35,36]	LEOPOLDO [31,32]	NEREIDE [29]
Parameter	L_{Amax}	SEL	SEL	SEL
Microphone heights	1 mic at 1.2 m height	2 mics at 1.2 m and 3 m height	2 mics at 1.2 m and 3 m height	1 mic at 4 m height
Measurement distance from road lane	7.5 m	7.5 m	7.5 m	3–15 m
Measurement conditions	Attended	Attended	Attended	Unattended
Events triggering	On site	On site	On site	In lab by use of counter traffic
Fitting technique	Linear fit	Linear fit	Binning linear fit	Binning linear fit

[ASC22]

Difference between ISO 11819-1 (SPB) and road side measurements during IMAGINE (SBP-HI)

- Parameter
  - Standardized SPB uses $L_{A,max}$
  - SPB-HI uses SEL (sound exposure level) from ISO 1996-1 [ISO16]

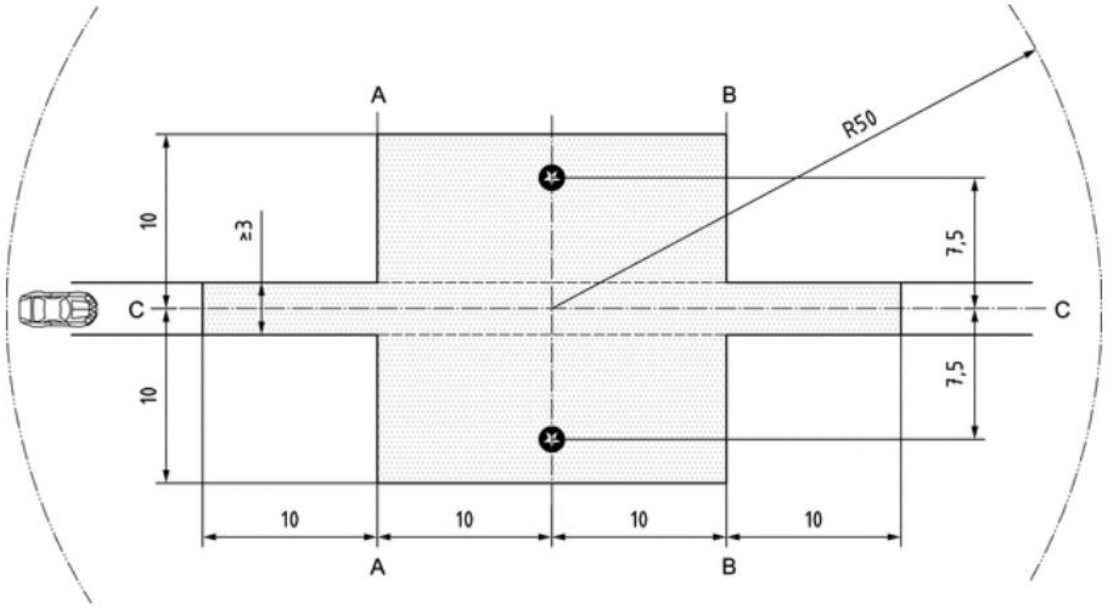
- Microphone height
  - Additional height of $3\ \mathrm{m}$

© fka GmbH

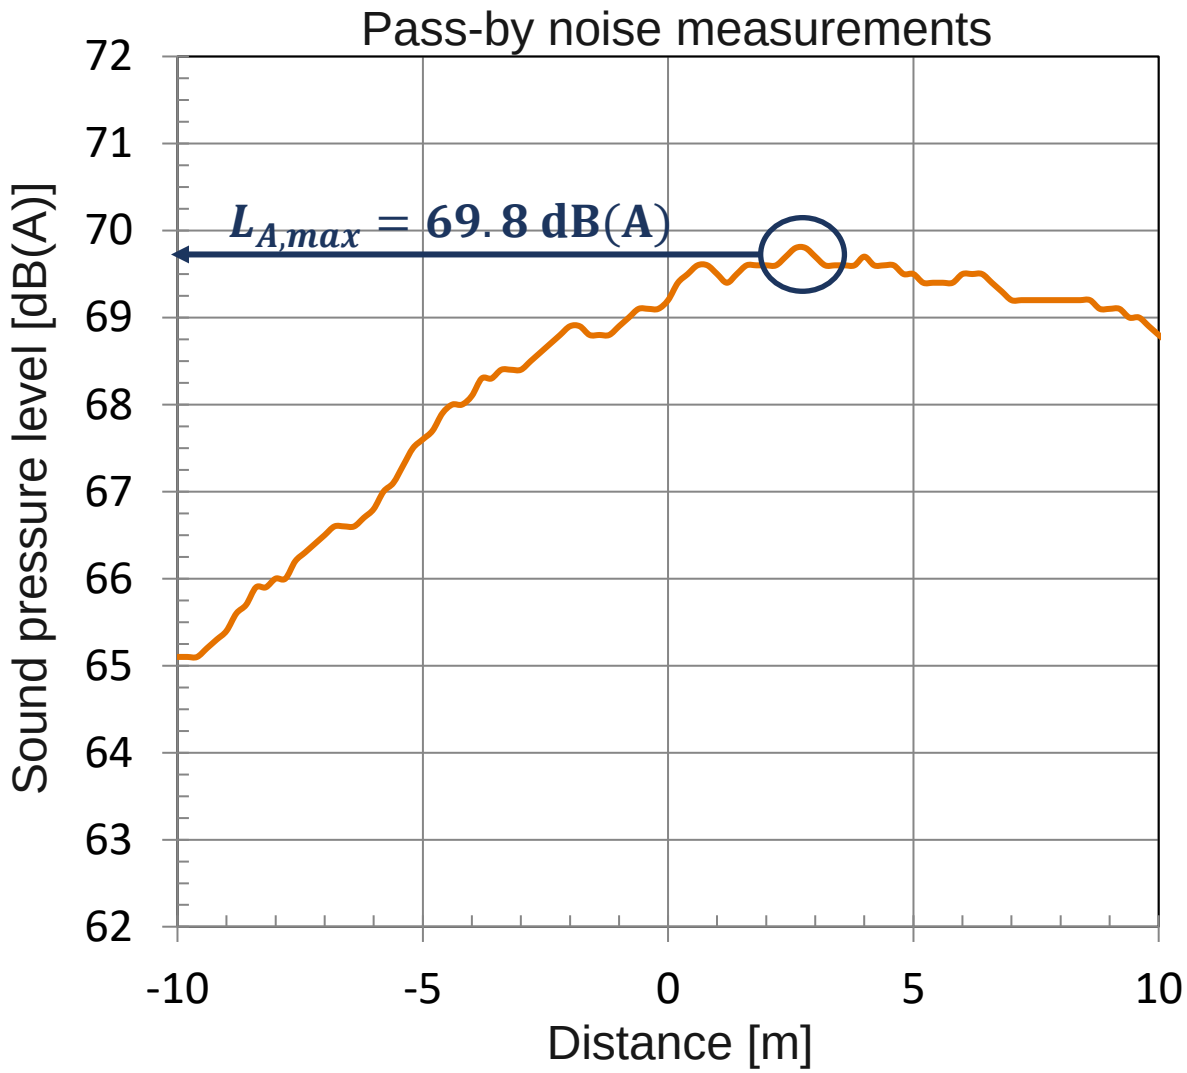
Overview on underlying data sets
Road side measurements – $L_{A,max}$

$L_{A,max}$ [ISO22a] [ISO22b]

» $L_{A,max}$ is the maximum A-weighted sound pressure level recorded during pass-by measurements



Microphone height 1.2 m

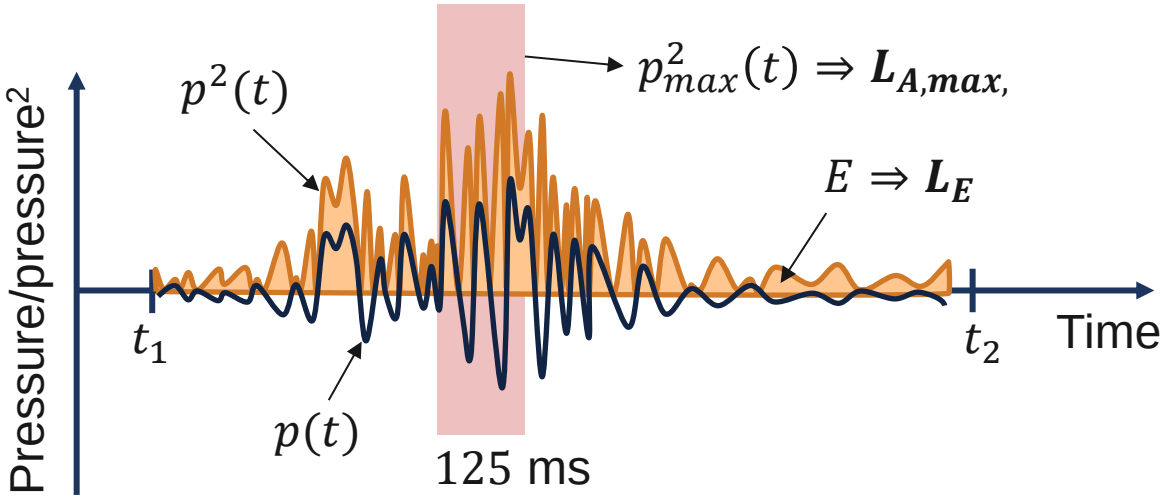


© fka GmbH

Overview on underlying data sets
Road side measurements – SEL

Sound exposure level [ASC22]

» “SEL was chosen by the NORDTEST method, HARMONOISE, IMAGINE […] projects for its representativeness in noise models and its ability to estimate the overall noise levels”

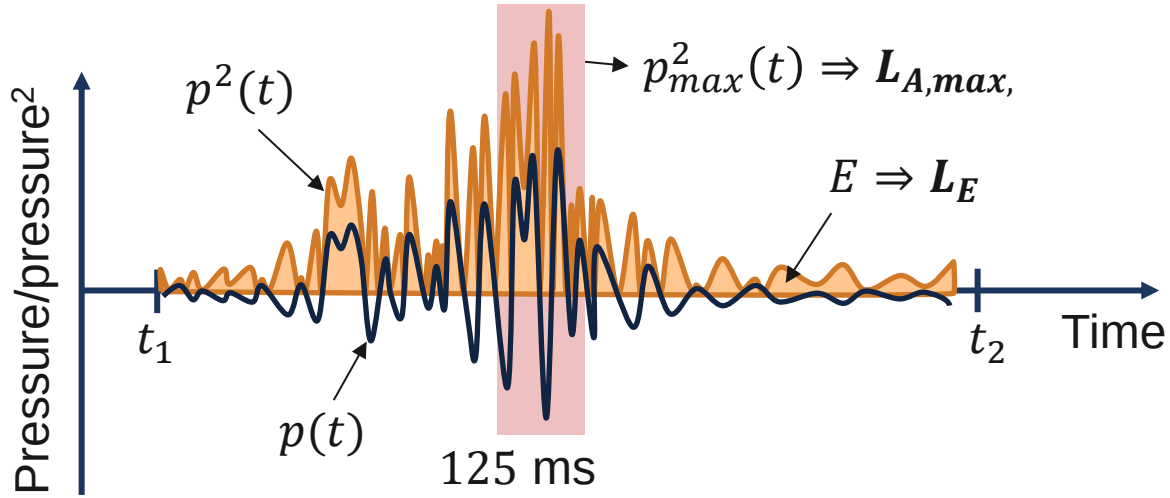


© fka GmbH

Overview on underlying data sets
Road side measurements – $L_{A,max}$ vs. SEL

$L_{A,max}$ vs SEL [ASC22]

- "SEL was chosen by the NORDTEST method, HARMONOISE, IMAGINE […] projects for its representativeness in noise models and its ability to estimate the overall noise levels"
- $L_{A,max}$ "is strongly dependent on the local peculiarities of the road (such as potholes, bumps, etc.) […] and vehicle discrepancies"
  - "results tend not to be stable even for the same vehicle and pavement"
  - Not the case for type approval measurements
- SEL is more sensitive to ground effects → <u>Second position at 3 m height</u>



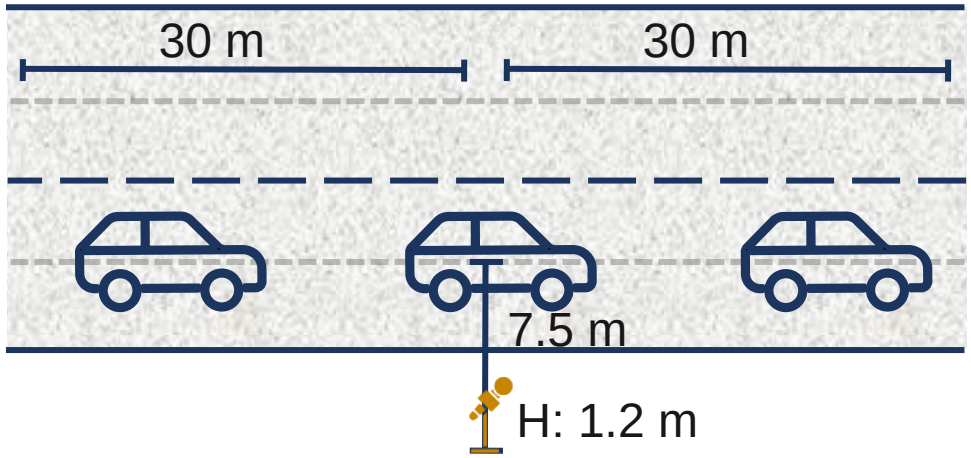
local peculiarity

The microphone height and the investigated parameter are the main differences between SPB and the measurements during IMAGINE for the derivation of the sound power coefficients. Therefore, further information about SPB measurements is shown in the following slides.

© fka GmbH

Overview on underlying data sets
Road side measurements – Statistical Pass-by (SPB)

SPB (ISO 11819-1) [ISO22b]



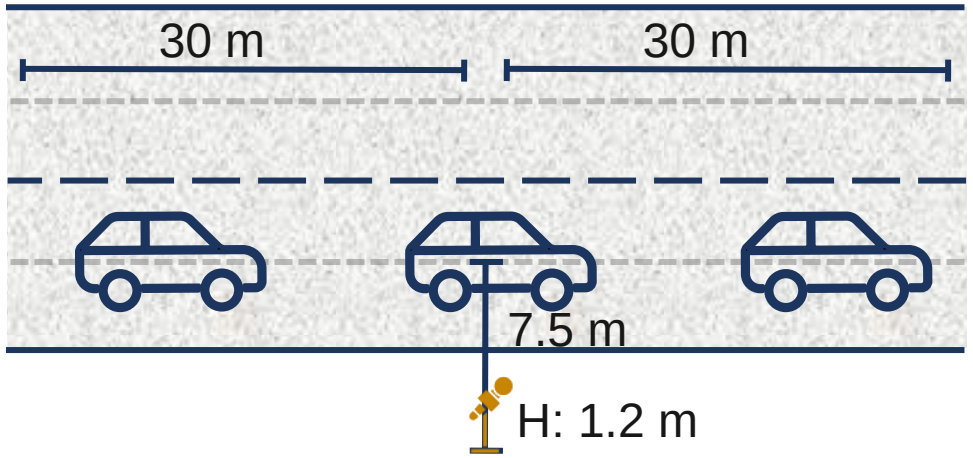
Measurement set up

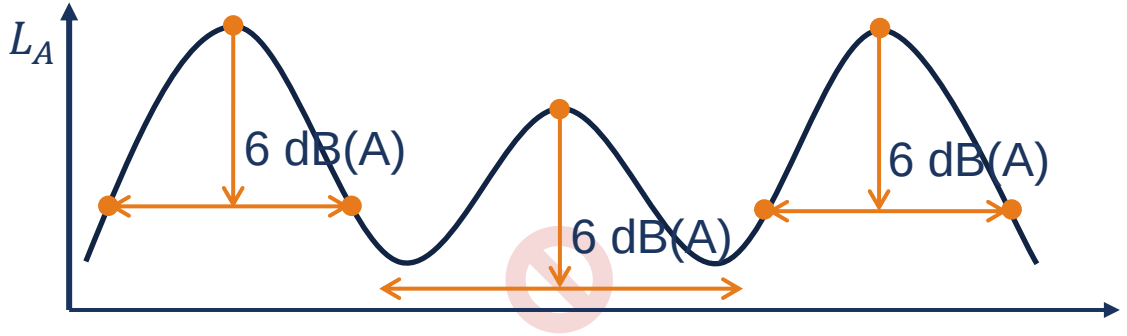
- Measurements usually on public roads
  - Specified road section: for cars ≥ 30m, for trucks ≥ 50m
  - Road must be mainly flat and straight (light turns/ gradients ≤ 2% negligible)
  - Road surface in good condition, but not new
- Measuring several vehicles passing by
- Requirements regarding free field conditions/no reflective objects

© fka GmbH

Overview on underlying data sets
Road side measurements – Statistical Pass-by (SPB)

SPB (ISO 11819-1) [ISO22b]





- At least 6 dB(A) before/after a event
- No correction values required

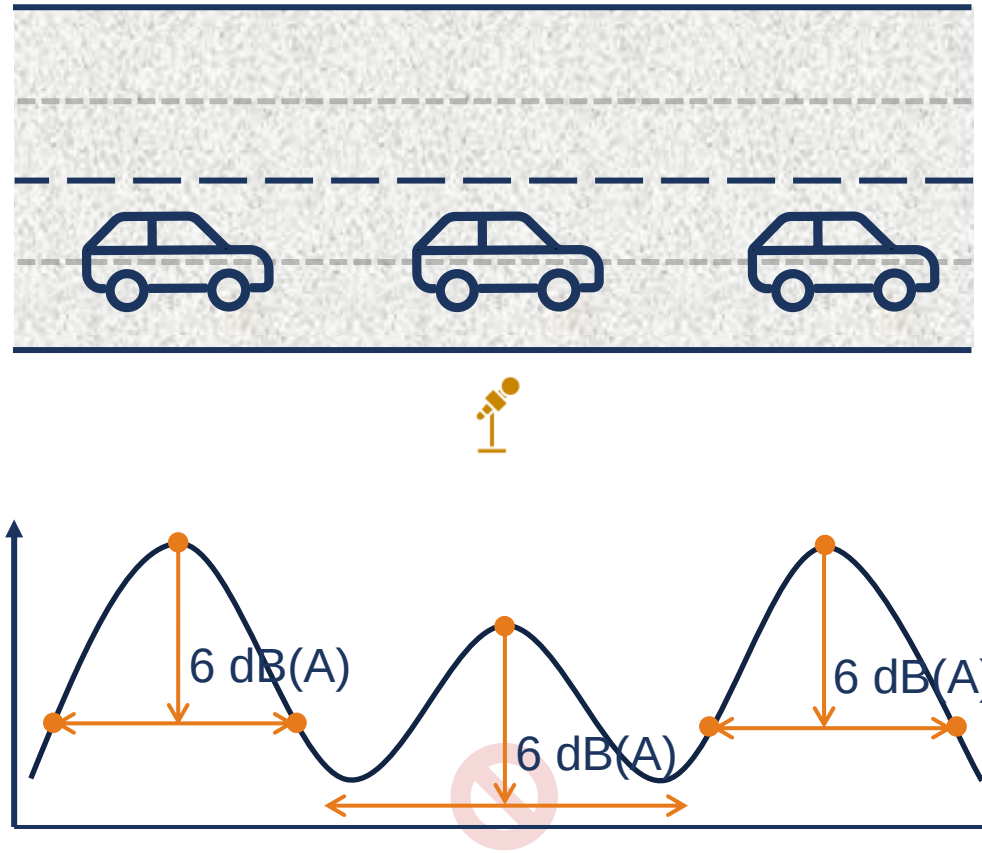
Speed parameter

- Reference speeds **depending on type of road**:
  - **Low** speed: Ø 45 $^{km}/_{h}$ - 64 $^{km}/_{h}$
  - **Medium** speed: Ø 65 $^{km}/_{h}$ - 99 $^{km}/_{h}$
  - **High** speed: Ø > 100 $^{km}/_{h}$
- Vehicle speed to be measured approximately when the centre of the vehicle passes the microphone

© fka GmbH

Overview on underlying data sets
Road side measurements – Statistical Pass-by (SPB)

SPB (ISO 11819-1) [ISO22b]



- At least 6 dB(A) before/after a event
- No correction values required

		Limit	Measurement accuracy
1	[°C]	5 – 35 °C	± 1°C
2	[m/s]	≤ 5 m/s	--
3	[%]	--	--
4	[hPa]	--	--

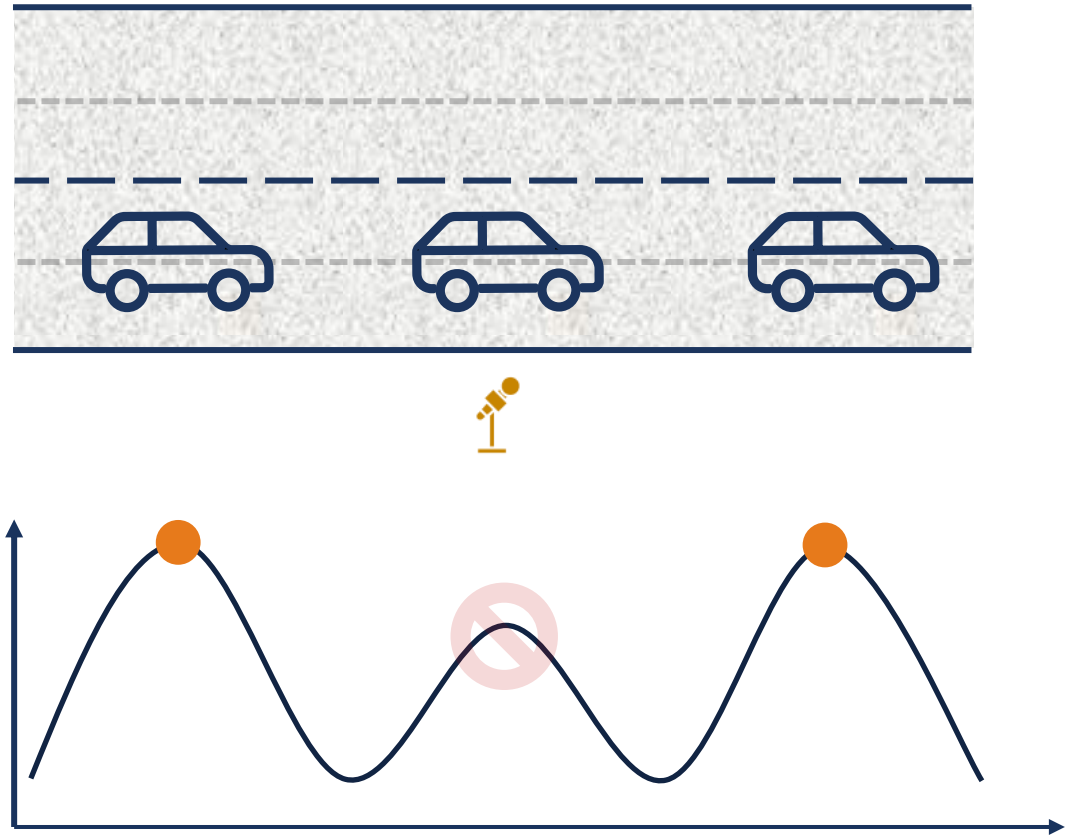
- A correction to reference of 20°C to be applied
- Recommended: correct every measurement
- Correction according to ISO/TS 13471-2

[1]: Temperature; [2]: Wind speed; [3]: Humidity; [4]: Air pressure

© fka GmbH

Overview on underlying data sets
Road side measurements – Statistical Pass-by (SPB)

SPB (ISO 11819-1) [ISO22b]



» Maximum sound pressure level $L_{A,max}$

Post-processing

» L_{SPB} from measurements of several vehicles

» Temperature correction (ISO/TS 1347-2)

» Statistical pass by index (SPBI) can be calculated:

$$SPBI = 10 \log[W_P \times 10^{\frac{L_{SPB:P,v_{ref,P}}}{10}} + W_H \left(\frac{v_{ref,P}}{v_{ref,H}}\right) \times 10^{\frac{L_{SPB:H,v_{ref,H}}}{10}}]$$

Vehicle	Road 1		Road 2		Road 3	
	v_{ref} [km/h]	W	v_{ref} [km/h]	W	v_{ref} [km/h]	W
Cars (P)	50	0,9	80	0,8	110	0,7
Trucks (H)	50	0,1	80	0,2	80	0,3

General information on Strategic Noise Maps (SNM)
Introduction

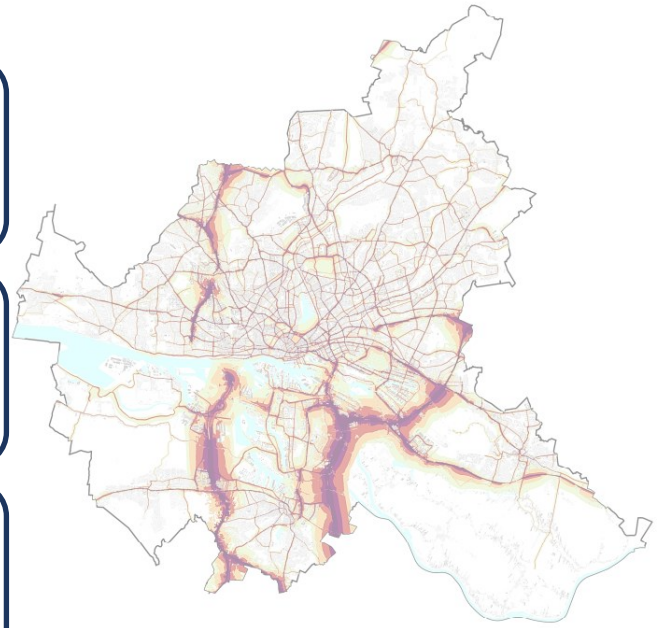
Strategic noise maps (SNM)

- Motivation: Evaluation of the effects of possibly erroneous calculations
- Definition SNM: A graphical representation of expected/measured noise
- Areas of application: Cities, roads, airports, and railroads (see **slide 51**)
- Limiting values: No mandatory limiting values defined
- For compliance with the environmental noise directive (END) 2002/49/EC:

- Determination of exposure to environmental noise
- Use of consistent calculation method (CNOSSOS) by all member states

- Ensuring that the public is informed about environmental noise and it's effects

- Derivation of action plans from SNM: Prevention & reduction of environmental noise if necessary

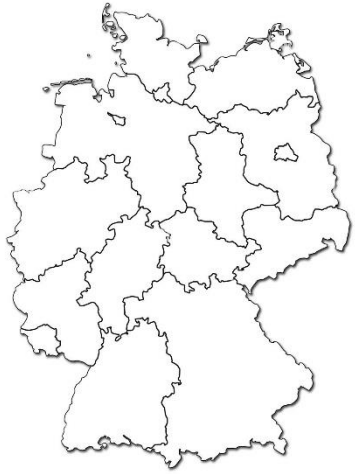


[EE23] [BU22]

© fka GmbH

General information on Strategic Noise Maps (SNM)
Regions for which Strategic Noise Maps must be created

- Metropolitan areas with a population of >100k
- Major roads with traffic volume >3 million vehicles per year
- Major railway lines with traffic volume >30k trains per year
- Major airports with traffic volume >50k movements per year



SNM can be published for whole federal states

SNM can be created only for mandatory areas

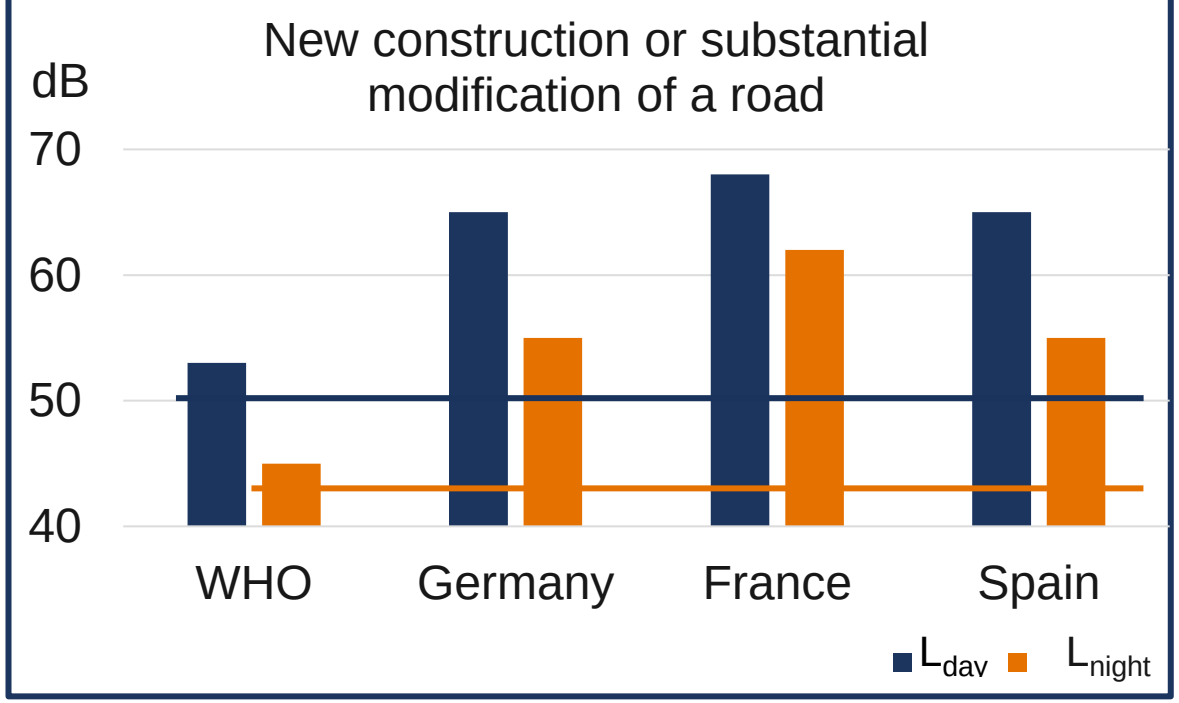
[AL23] [EE23] [EP20]

© fka GmbH

General information on Strategic Noise Maps (SNM)
Limiting values & derivation of action plans

Overview of noise limits

- No consistent limiting values for EU
- Limiting values do exist on national level
- Significant differences (see diagram below)



Creation of noise action plans

- EU member states must ensure health of their inhabitants → Noise action plans
- Noise action plans from European Environmental Agency as a guideline

List of possible mitigation measures:

- Counter measures at the source (speed reduction)
- Counter measures at the transfer path (noise barriers)
- Urban planning (noise quality areas)
- Infrastructural changes
- Community engagement (counter measures for behavioral changes)

Strategic Noise Maps over the last years

2007

2012

- SNM already derived before 2007 (before mandatory in the EU)
  - Not considered here due to lack of comparability (different calculation methods)

2017

- **Interim calculation method introduced for comparability called VBUS**
  - VBUS: Preliminary calculation method for Road Environmental Noise
  - L_{DEN} as a function of weighted L_{Day}, $L_{Evening}$ and L_{Night}
  - Differences based on different software versions
- **The new SNM for the fourth round (2022) isn't published yet**

New software version

[BU17]

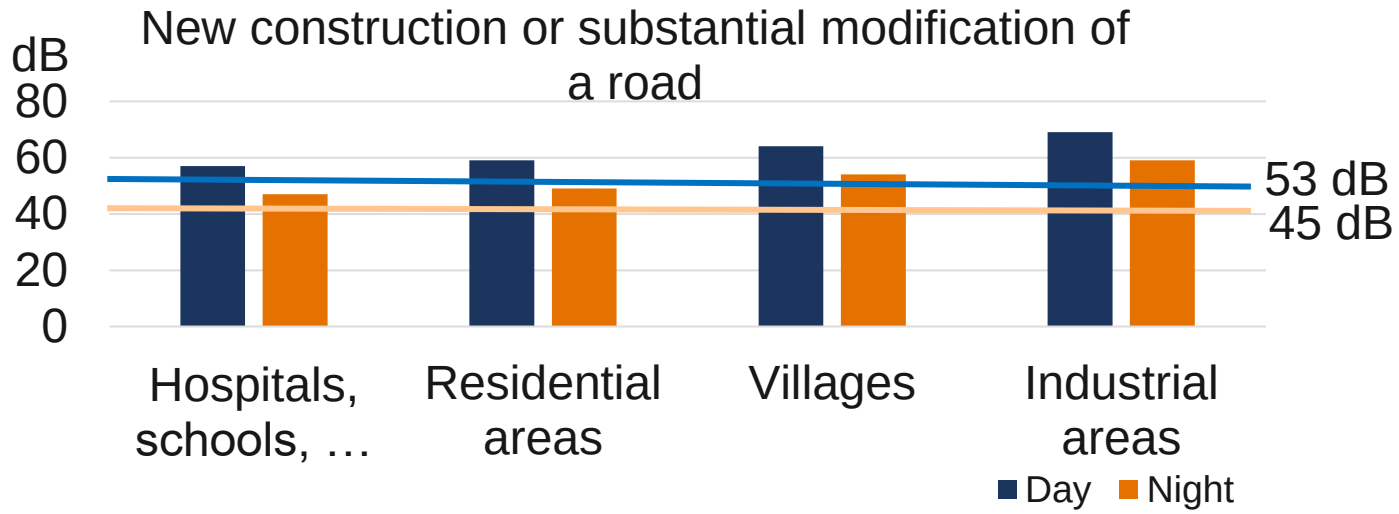
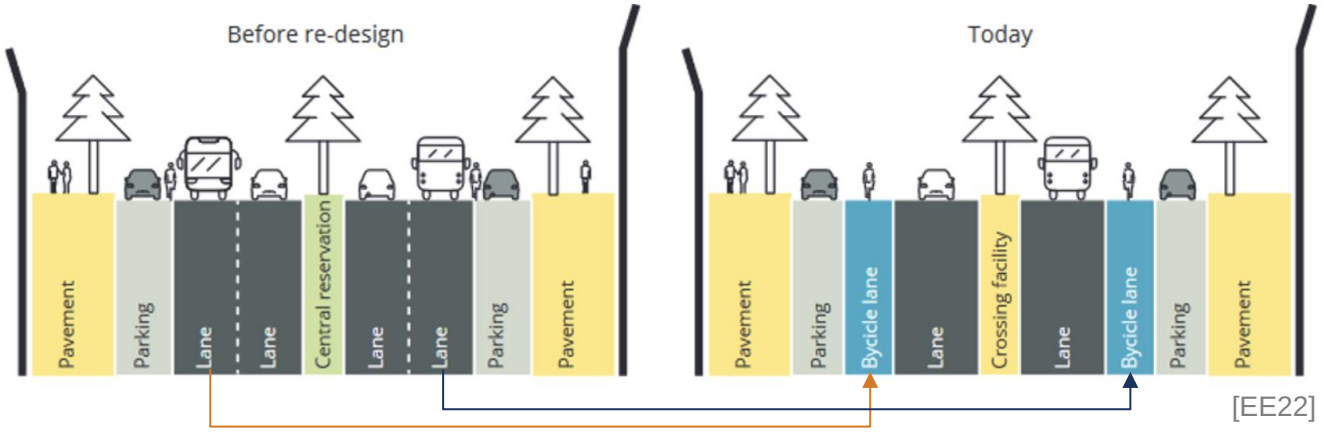
Detailed information for exemplary cities – Berlin
Counter measures resulting from the Strategic Noise Maps

- **In general:**
  - Existing roads: No regulation → no legal entitlement to noise remediation
  - Renewed/new road: Depicted noise values must be considered (acc. to German environment agency)



- **SNM in 2007: Redesign of roads to minimise noise emissions**
  - Road types affected: Two lines in each direction and traffic volume >20.000 vehicles per day
  - Measure: Lane for bicycles



[EE22]

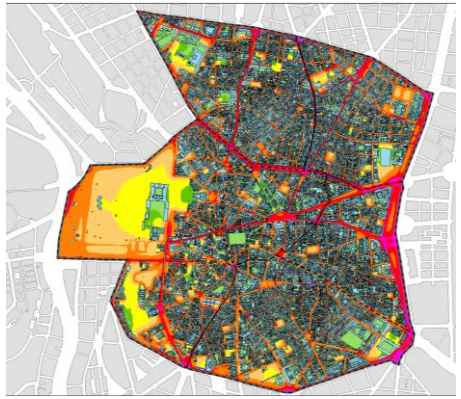
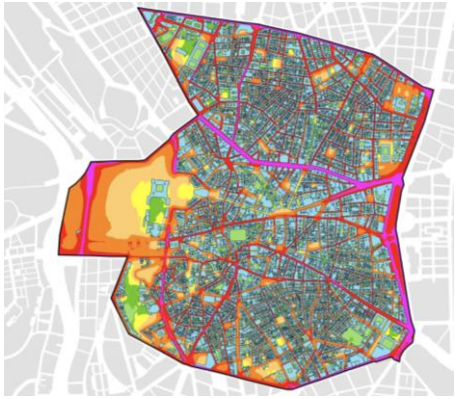
Detailed information for exemplary cities – Madrid
Strategic Noise Maps over the last years

2007



2012



More measurement positions

2007 & 2012

- SNM were created according to districts
- Differences between these years are mainly based on the expansion of the measurement positions

- 2017: Calculation method changed (counting light and heavy vehicles)
- 2022: first year CNOSSOS was used
  - Lower noise levels are caused by the new calculation method

2017

2022

CNOSSOS was used

[TP23]

© fka GmbH

Detailed information for exemplary cities – Madrid
Used Calculation Methods

- **2007 & 2012 SNM in Madrid were based on direct measurements**
  - 4395 measuring points
  - Using SADMAN software for data collection & SNM generation
  - High costs for such measurement procedure, mainly due to maintenance of the measuring points

- **2017: SNM based on vehicles counts**
  - Differentiation between heavy and light vehicles

- **2022: SNM based on CNOSSOS**
  - Significant noise reduction between 2017 & 2022 due to CNOSSOS-EU (4 different vehicle categories)

[TP23]

© fka GmbH

Detailed information for exemplary cities – Madrid
Counter measures resulting from the Strategic Noise Maps

- **Counter measures & preparation of 4th Round (2022) of SNM characterised by the following factors:**
  1. Implementation CNOSSOS calculation method
  2. Restriction on hours of operation (roadworks, public outdoor events/festivals, …)
  3. Promotion of public transport

- **Significant decrease in noise levels between 2012 & 2017**
  - Number of people exposed to high noise levels decreased by 47% during the day and by 38% at night

- **This is mainly due to the following counter measures:**
  - Reduction of traffic intensity
  - New pedestrian zones
  - Promotion of public transport
  - Sound absorbing asphalt

	People exposed to high noise levels [%]		Reduction from 2012 to 2017 [%]
	In 2012	In 2017	
L_{day}	4,1	2,2	46,7
$L_{evening}$	2,9	1,6	46,4
L_{night}	14,9	9,3	37,9

Detailed information for exemplary cities – Paris
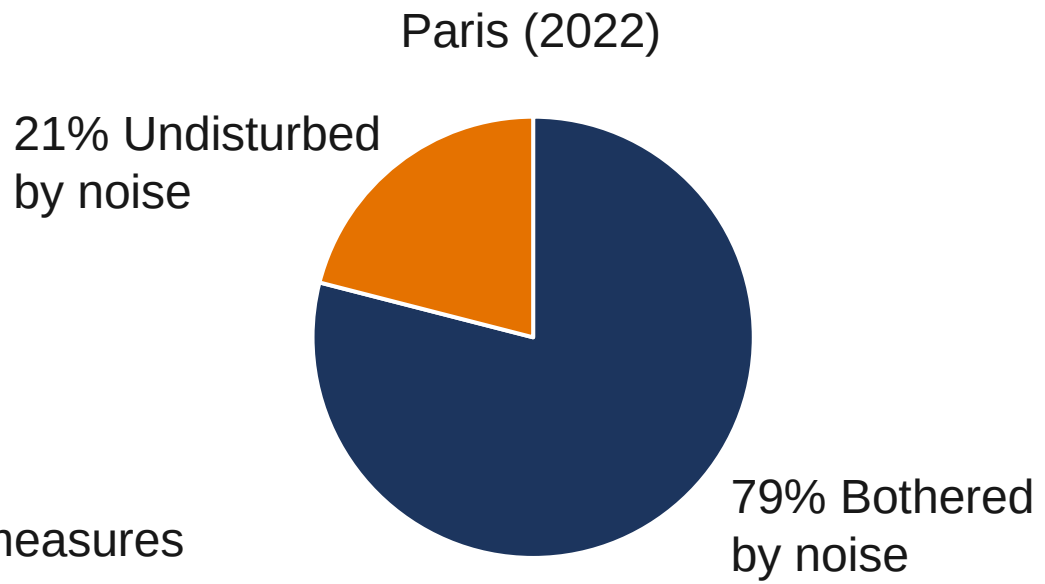
Counter measures resulting from the Strategic Noise Maps

- **In 2022, 79 % of residents are bothered by noise**

- **Main source for noise pollution: Road traffic**

- **Previous noise action plan 2015-2020:**
  - Reduction of noise by ~2 dB

- **Current noise action plan 2021-2026:**
  - Aim: ~2% per year overall decrease due to 34 counter measures
  - Counter measure categories:
    1. Environmental noise: traffic noise, asphalt quality, noise from commercial facilities
    2. Neighbourhood noise: restaurants, public outdoor events/festivals, hours for roadworks/road cleaning, sound emissions of rubbish trucks/street sweepers, …
  - Major counter measures:
    - Speed limit of 30 km/h except for ring road (70 km/h) and some major roads (50 km/h)
    - Extension of bicycle lanes



[PF22] [FG19]

Question/remark: Is this value correct?

[PAR22] [BRU19]

© fka GmbH

Detailed information for exemplary cities – Paris
Counter measures resulting from the Strategic Noise Maps

Noise reduction in Paris

The quality of the capital's sound environment is improving due in particular to:

- The generalization of the speed limit to 30 km/h on all Parisian roads (except the ring road at 70 km/h and some major axes maintained at 50 km/h),
- The overall reduction in road traffic in Paris, of approximately 2% per year on the instrumented network, due in particular to the extension of the lanes reserved for bicycles.

- Here:
  - Result of the previous noise action plan in paris (PPBE 2015 – 2020) → 2% reduction of road traffic flow
- EU action plan towards zero pollution:
  - Reduction of people chronically disturbed by transport noise by 30%

Impact of road traffic on noise pollution

- Main source of noise pollution in outdoor environment in Île-de-France: road traffic
  - It is responsible for 79% of people potentially exposed to noise limit values being exceeded

General information on Strategic Noise Maps (SNM)
Summary

So far, every country used different & varying calculation methods to create SNM → No comparability → Introduction of CNOSSOS-EU

The level of publication isn't regulated: Every member state can publish their SNM on a country-, federal state-, city-, … basis

The counter measures to reduce noise differ significantly. There is no procedure specified for the derivation of counter measures from SNM, however, the member states must ensure the health of their citizens

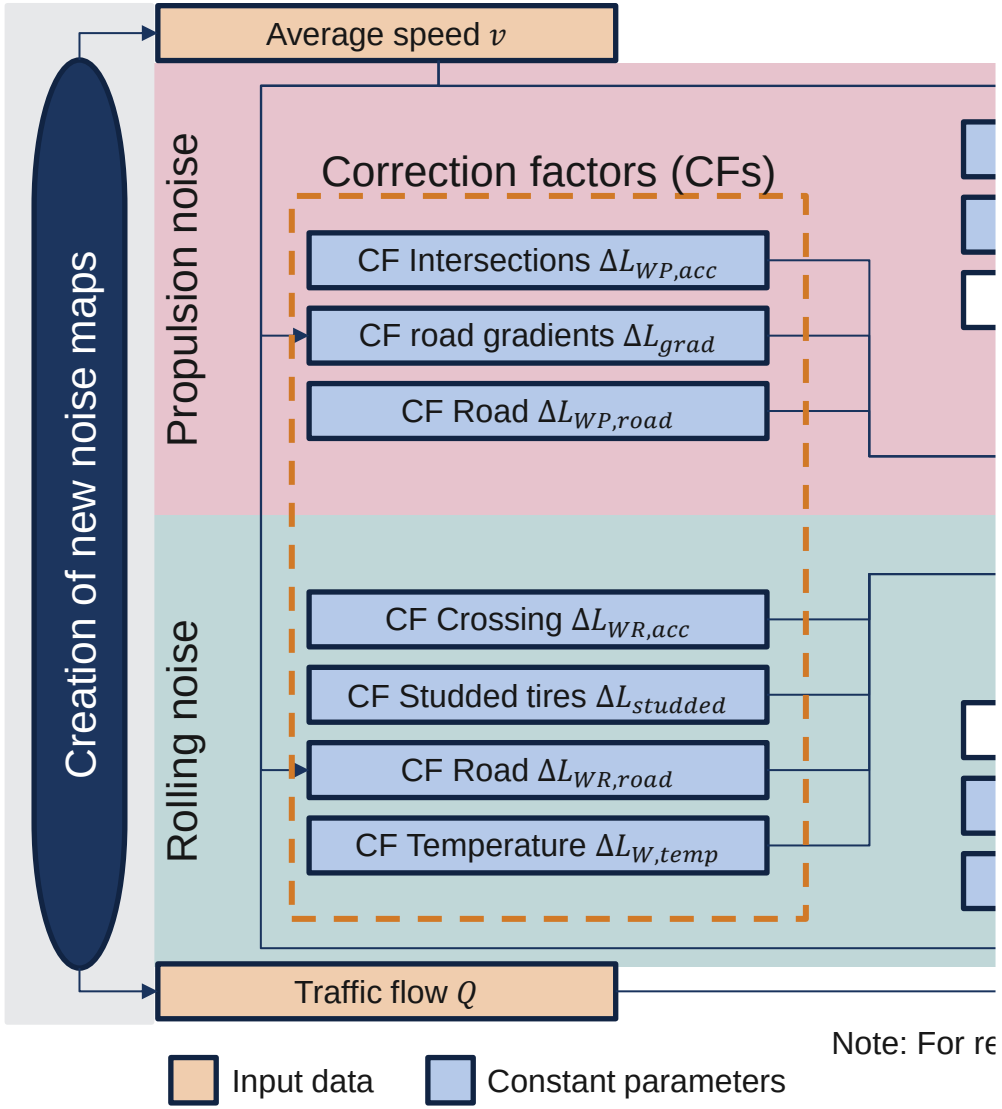
Flow chart for CNOSSOS-EU



CNOSSOS-EU vehicle sound source description [EUR15]

- Noise emission as a function of vehicle speed and frequency (equation based)

- Rolling noise $L_{WR} = A_R + B_R \cdot \log\left(\frac{v}{v_{ref}}\right) + \Delta L_{WR}$
- Propulsion noise $L_{WP} = A_P + B_P \cdot \frac{v - v_{ref}}{v_{ref}} + \Delta L_{WP}$
- Overall sound level $L_W = 10 \cdot \log(10^{0.1 L_{WR}} + 10^{0.1 L_{WP}})$

- $v_{ref} = 70$ kph
- Correction factors (CFs)

Question: Why is the reference speed for CNOSSOS-EU 70 kph?

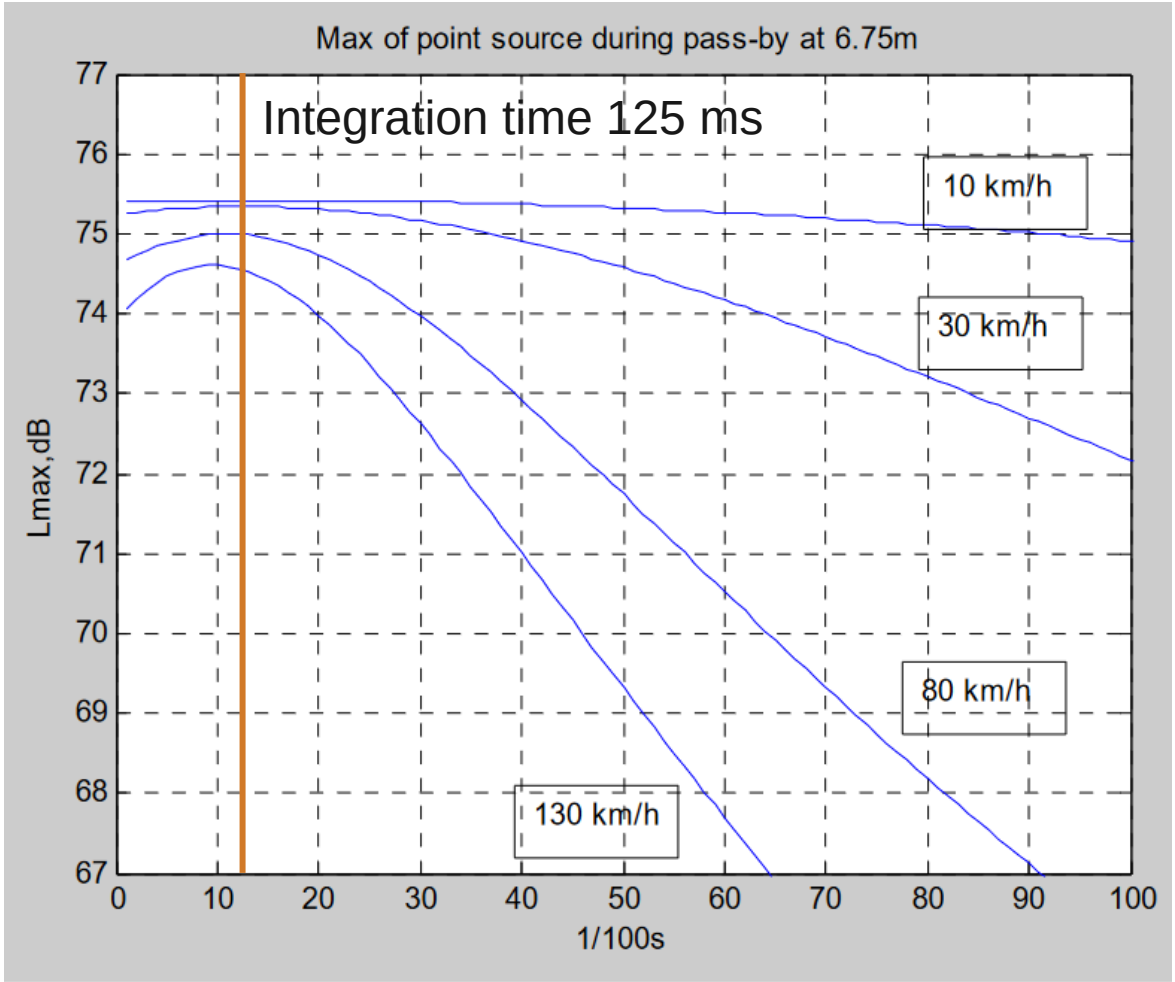
© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE

CNOSSOS-EU – reference speed 70 km/h

Reference speed in HARMONOISE reports

- In CNOSSOS-EU no reason is given why 70 km/h is chosen
  - It was used from HARMONOISE onwards
- [JON06] regarding HARMONOISE model: „Another problem to consider for predictions is the integration time at short distances. […] We can see that time-weighting F is too slow to yield the true maximum level above about 30 km/h. However, if we select 70 or 80 km/h as reference speed the error will be within +0,3 dB which is quite acceptable for the short distance of 6,75 m. For longer distances this effect will decrease and can thus be disregarded."
  - 6.75m corresponds to the distance from the wheels to the SPB microphone



[JON06]

© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE

CNOSSOS-EU – reference speed 70 km/h

Reference speed in HARMONOISE reports

- In CNOSSOS-EU no reason is given why 70 km/h is chosen
  - It was used from HARMONOISE onwards
- [JON06] regarding HARMONOISE model: „Another problem to consider for predictions is the integration time at short distances. […] We can see that time-weighting F is too slow to yield the true maximum level above about 30 km/h. However, if we select 70 or 80 km/h as reference speed the error will be within +0,3 dB which is quite acceptable for the short distance of 6,75 m. For longer distances this effect will decrease and can thus be disregarded."
  - 6.75m corresponds to the distance from the wheels to the SPB microphone

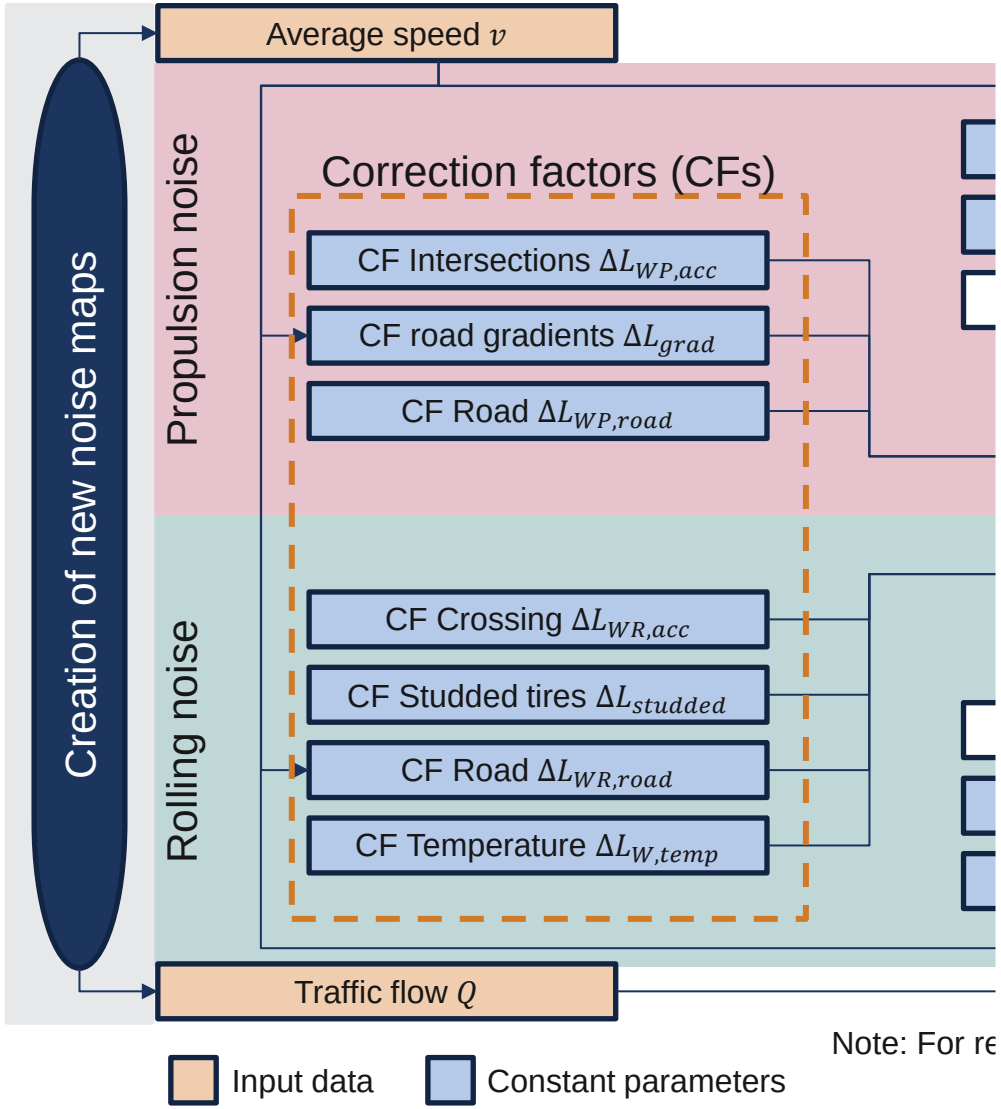
Reference speed – Analysis

- One difficulty for choosing the reference speed was the short distance between source (vehicle) and receiver (microphone) during measurements
- This means that a reference speed above 30 km/h but below 70 km/h would have led to a higher error in prediction while using with time-weighting F
- Higher speeds (like 70 km/h) lead to an smaller error of less than 0.5 dB which was considered acceptable during HARMONOISE

© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE

Flow chart for CNOSSOS-EU



CNOSSOS-EU vehicle sound source description [EUR15]

- Noise emission as a function of vehicle speed and frequency (equation based)

- Rolling noise $L_{WR} = A_R + B_R \cdot \log\left(\frac{v}{v_{ref}}\right) + \Delta L_{WR}$
- Propulsion noise $L_{WP} = A_P + B_P \cdot \frac{v - v_{ref}}{v_{ref}} + \Delta L_{WP}$
- Overall sound level $L_W = 10 \cdot \log(10^{0.1 L_{WR}} + 10^{0.1 L_{WP}})$

- $v_{ref} = 70$ kph
- Correction factors (CFs)

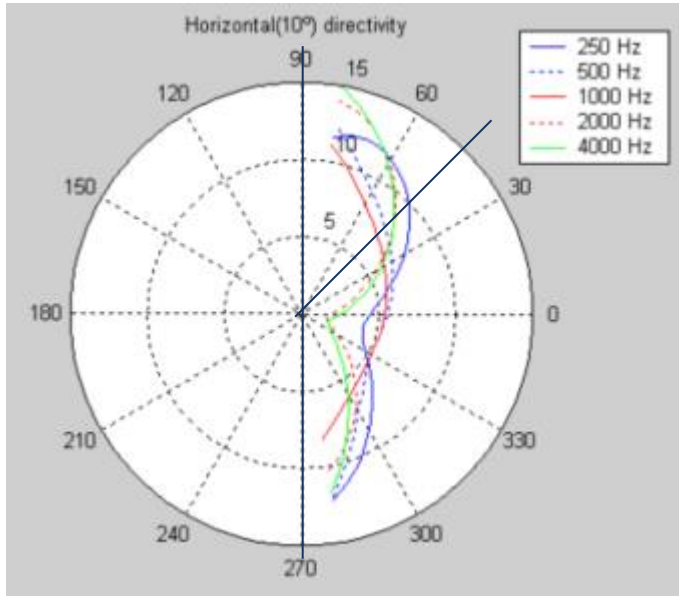
Question: How are the coefficients A_R, B_R, A_P, B_P derived?

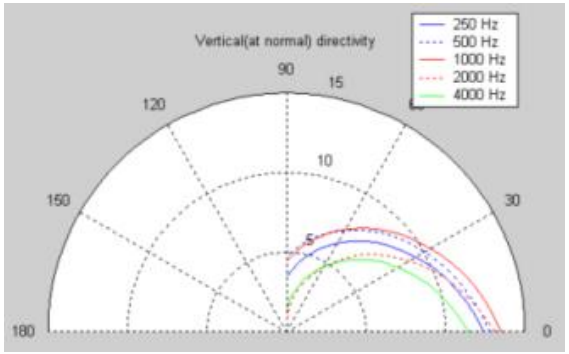
© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE
Sound power coefficients – Derivation from measurements

Directivity – HARMONOISE – State of the art

- Not much data available on frequency dependency
- Accurate source modelling requires directivity due to:
  1. Horn effect (amplification due to geometry)
  2. Acoustic shielding by the vehicle itself
- General characteristics of vertical directivity:
  - Only small directivity 0° - 45°
  - >45° decrease by 5 dB
- General characteristics of horizontal directivity:
  - Perpendicular to the road lowest radiation due to horn effect (not depicted due to low vehicle speed of 40 km/h)
  - At ~45° increase by 3-5 dB
  - Slightly higher radiation in backward direction



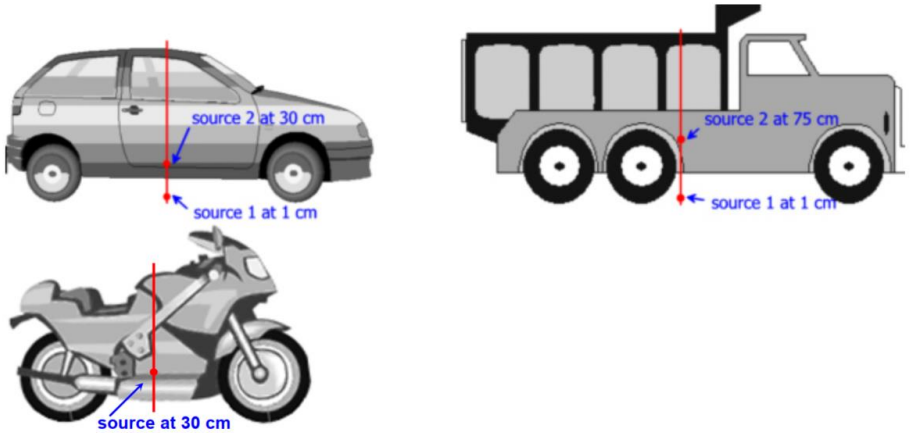


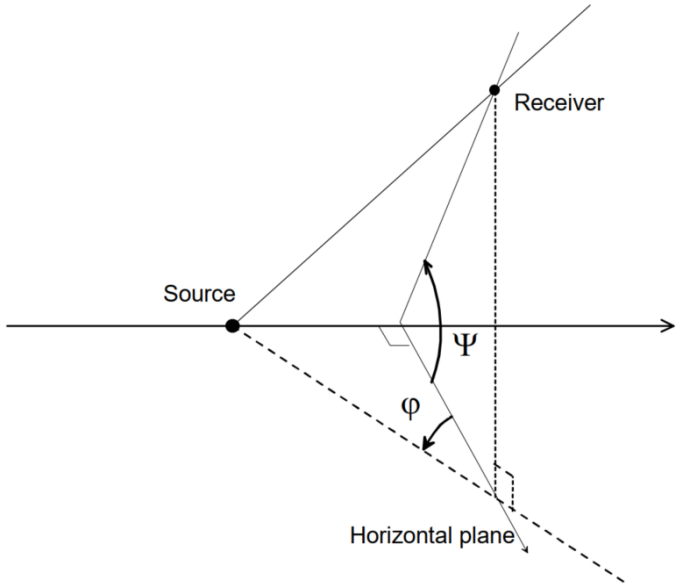
[JON04]

© fka GmbH

Directivity – HARMONOISE

- Vertical directivity:
  - All point sources: frequency dependent (vehicle shielding)
- Horizontal directivity:
  - Lowest point source: frequency dependent (rolling noise horn effect)
  - Highest point source: frequency independent (propulsion noise)
- Directivity function:
  - $\Delta L(f, \varphi, \psi) = \Delta L_H(f, \varphi) + \Delta L_V(f, \psi)$





[JON04] [IMA07]

© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE
Sound power coefficients – Derivation from measurements

Directivity – HARMONOISE – Vertical

- Measurement setup by Autostrade:
  - At night on public streets
  - On one lane of a motor way (other lanes blocked)
  - 5 microphones (arc with 7.5m)
- Derivation of directivity for HARMONOISE:
  - These measured curves were approximated by means of functions
  - For easier use: no differentiation of vehicle category

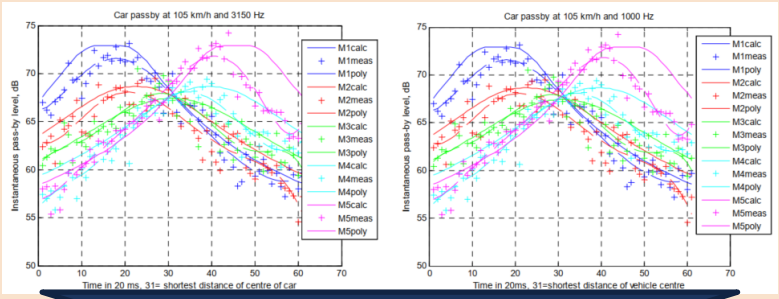
Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE
Sound power coefficients – Derivation from measurements

Directivity – HARMONOISE – Horizontal

- Various measurement have been considered, e.g.:
  - Pass by measurements on public streets (Autostrade)
  - 5 microphones in an half-sphere (1.2 m)
- Source height 0.01 m (accounting for horn effect):
  - $\Delta L_H(f,\varphi) = 0 \qquad (f \leq 1250\ Hz\ \&\ f > 8000\ Hz)$
  - $\Delta L_H(f,\varphi)$: dependent on φ and ψ $(1600 \leq f \leq 6300\ Hz)$
- Source height 0.3 m (propulsion):
  - $\Delta L_H(f,\varphi) = 0$
- Source height 0,75 m (propulsion):
  - $\Delta L_H(f,\varphi)$: dependent on φ and ψ
- Factor $\sqrt{\cos(\psi)}$ is included to avoid computational issues
  - ψ is not defined on top of the car
  - $\cos(\psi)$ decreases the influence close to horizontal plane

Measured



Approximation

"The conclusions are not obvious."

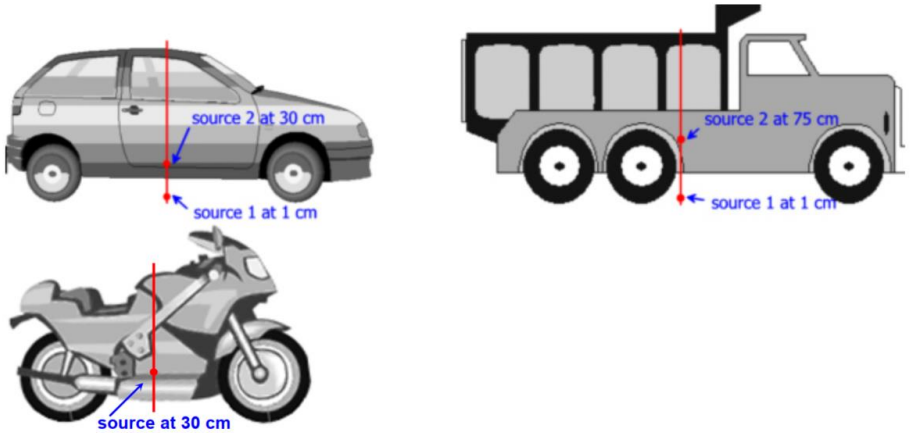
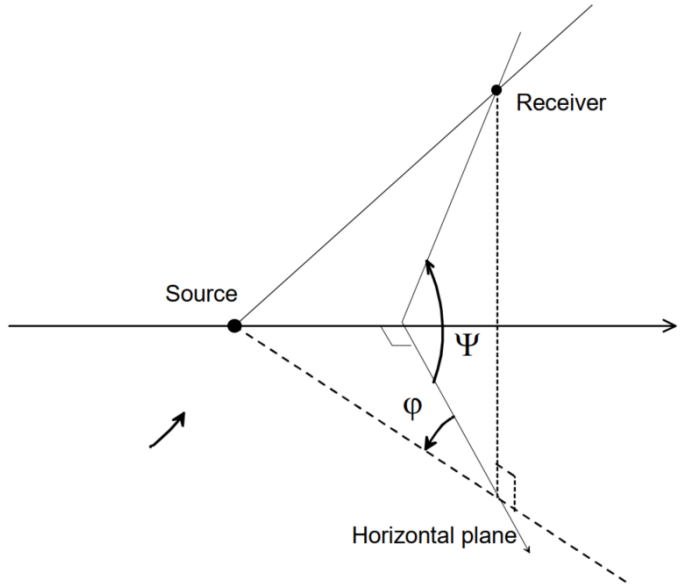
Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE
Sound power coefficients – Derivation from measurements

Directivity – IMAGINE

- In IMAGINE it is referred to HARMONOISE for detailed information
- However, due to high complexity, the functions are simplified:
  1. Neglection of horizontal directivity
     - Since no impact on L_{eq} (equivalent sound pressure level)
     - But: Consideration for L_{max} (max. sound pressure level)
  2. No frequency dependence for vertical directivity
     - Category 1: $\Delta L(\psi) = -\frac{\psi}{20°}\ [dB]$ → 90° ≙ -4.5 dB
     - Category 2&3: $\Delta L(\psi) = -\frac{\psi}{30°}\ [dB]$ → 90° ≙ -3 dB
  - Note: Significant deviation expected for low frequencies





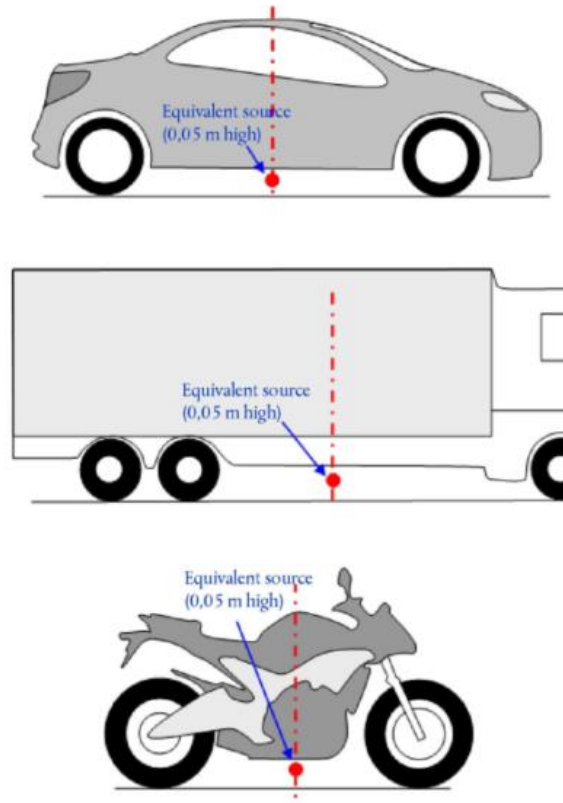
[IMA07]

© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE
Sound power coefficients – Derivation from measurements

Directivity – CNOSSOS-EU

- Very little information in the current directive [EU15]:
  - "$L_{W,i,m}$ is the directional sound power of a single vehicle"
  - "each vehicle […] is represented by one single point source radiating uniformly into the 2-π half space"
- However, in a draft document it is stated [EUR11]:
  - "For noise mapping purposes, road vehicles can be reasonably modelled as omnidirectional point sources"
  - "in specific cases such as the determination of sound power levels from vehicle pass-by measurements, […] the point sources should be assigned both horizontal and vertical directivity"



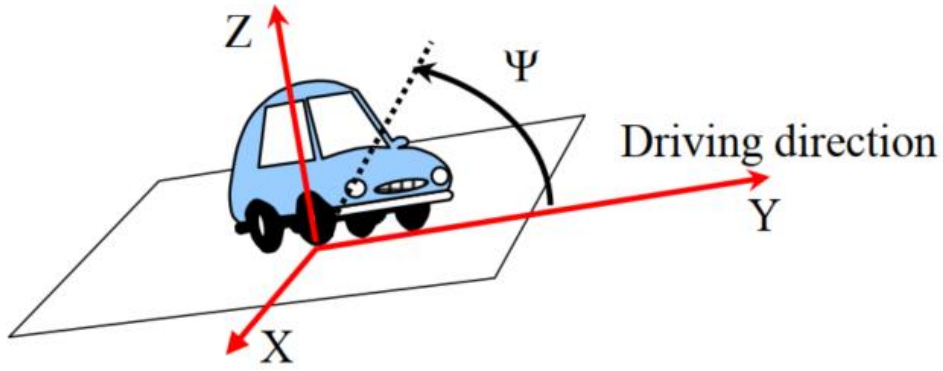
[EUR11] [EU15]

© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE
Sound power coefficients – Derivation from measurements

Directivity – CNOSSOS-EU

- Overall directivity correction [EUR11]
  - $\Delta L_{W,dir} = \Delta L_{W,dir,hor} + \Delta L_{W,dir,vert}$
- Horizontal directivity can be neglected for road vehicles
- Vertical directivity is the same as in IMAGINE
  - Category 1: $\Delta L_{W,dir} = -\frac{9\psi}{\pi}$ [dB] → $\frac{\pi}{2}$ ≙ -4.5 dB
  - Category 2&3: $\Delta L_{W,dir} = -\frac{6\psi}{\pi}[dB]$ → $\frac{\pi}{2}$≙ -3 dB
- Again:
  - No directivity effect is defined for category 4 (two-wheelers)
  - For low frequencies strong deviations expected due to interference
- ➢ Were the coefficients determined using this approach?



[EUR11]

© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE
Sound power coefficients – Derivation from measurements

Information from [EUR11] & [EUR15]

- First draft for CNOSSOS-EU [EUR11]:
  - An <u>empty appendix</u> is included regarding the procedure to derive the coefficients
  - "To be inserted (from Harmonoise/Imagine report)"
- Final directive [EUR15]:
  - <u>No information on derivation of coefficients</u>

Draft [EUR11]:

Appendix III-B – Procedure applied to derive reference coefficients for sound power emission of road vehicles

To be inserted (from Harmonoise/Imagine report)

Further editing

Final directive [EUR15]:

No information on the procedure of the coefficient derivation included

CNOSSOS-EU revision [EUR21]

CNOSSOS-EU has been updated in 2021 with [EUR21]

- **Adaptions were made for, e.g.**
  - Correction factors
  - Sound power coefficients

CNOSSOS-EU coefficients “initial” [EUR15]

Coefficients $A_{R,i,m}$ and $B_{R,i,m}$ for rolling noise and $A_{P,i,m}$ and $B_{P,i,m}$ for propulsion noise

Category	Coeffi-cient	63	125	250	500	1 000	2 000	4 000	8 000
1	A_R	79,7	85,7	84,5	90,2	97,3	93,9	84,1	74,3
	B_R	30	41,5	38,9	25,7	32,5	37,2	39	40

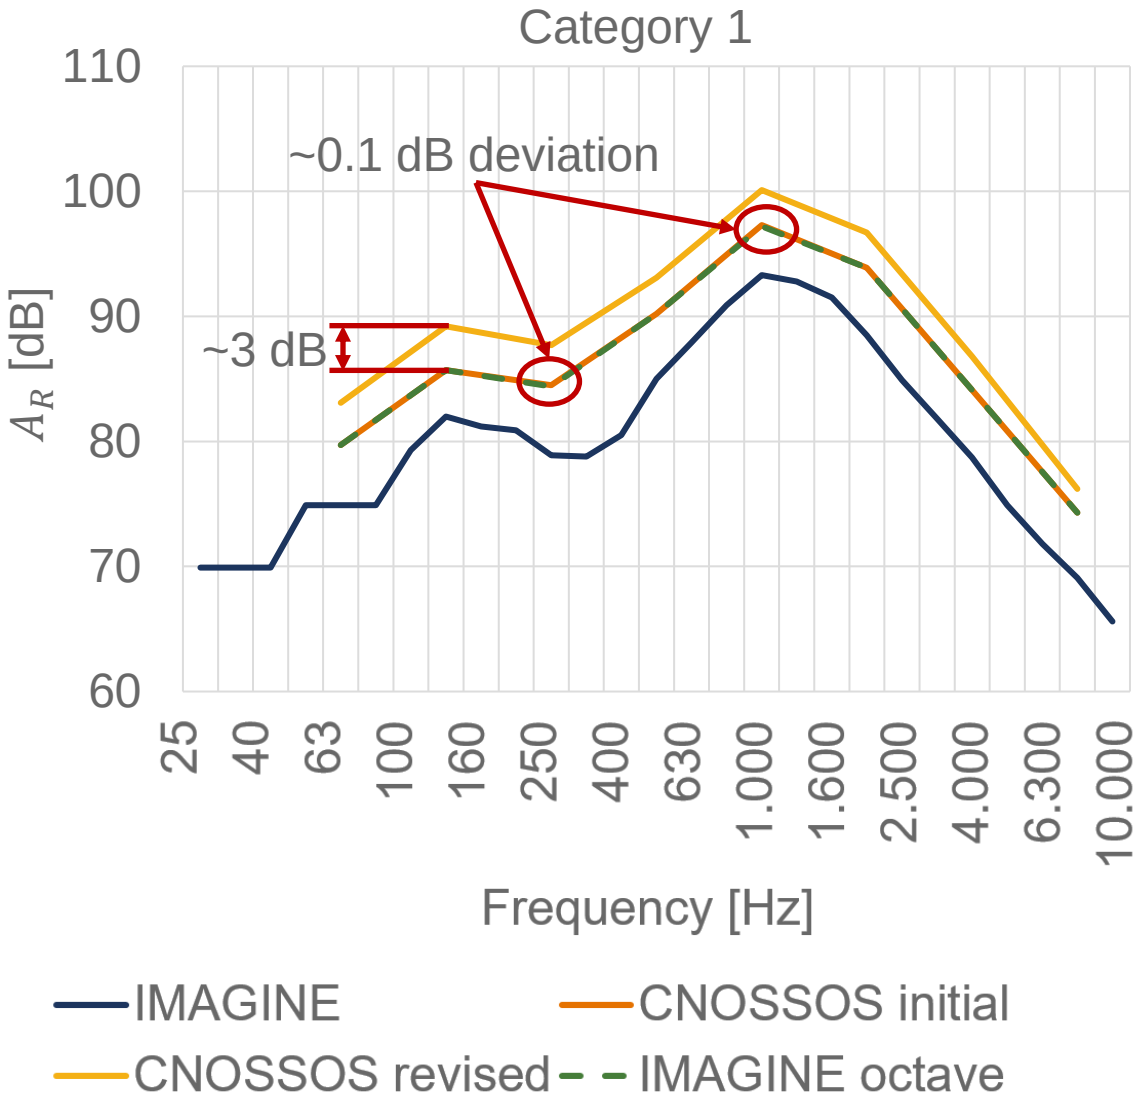
Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE

Sound power coefficients – Category 1 – Rolling noise – A_R

Coefficients [EUR15], [EUR21] & [IMA07b]

- Speed-independent rolling coefficients
- Note: CNOSSOS octave and IMAGINE 1/3 octave
- Key messages:
  - Summing the 1/3 octaves from IMAGINE results in the initial CNOSSOS coefficients
  - Only for 250 Hz and 1000 Hz a deviation of 0.1 dB can be detected



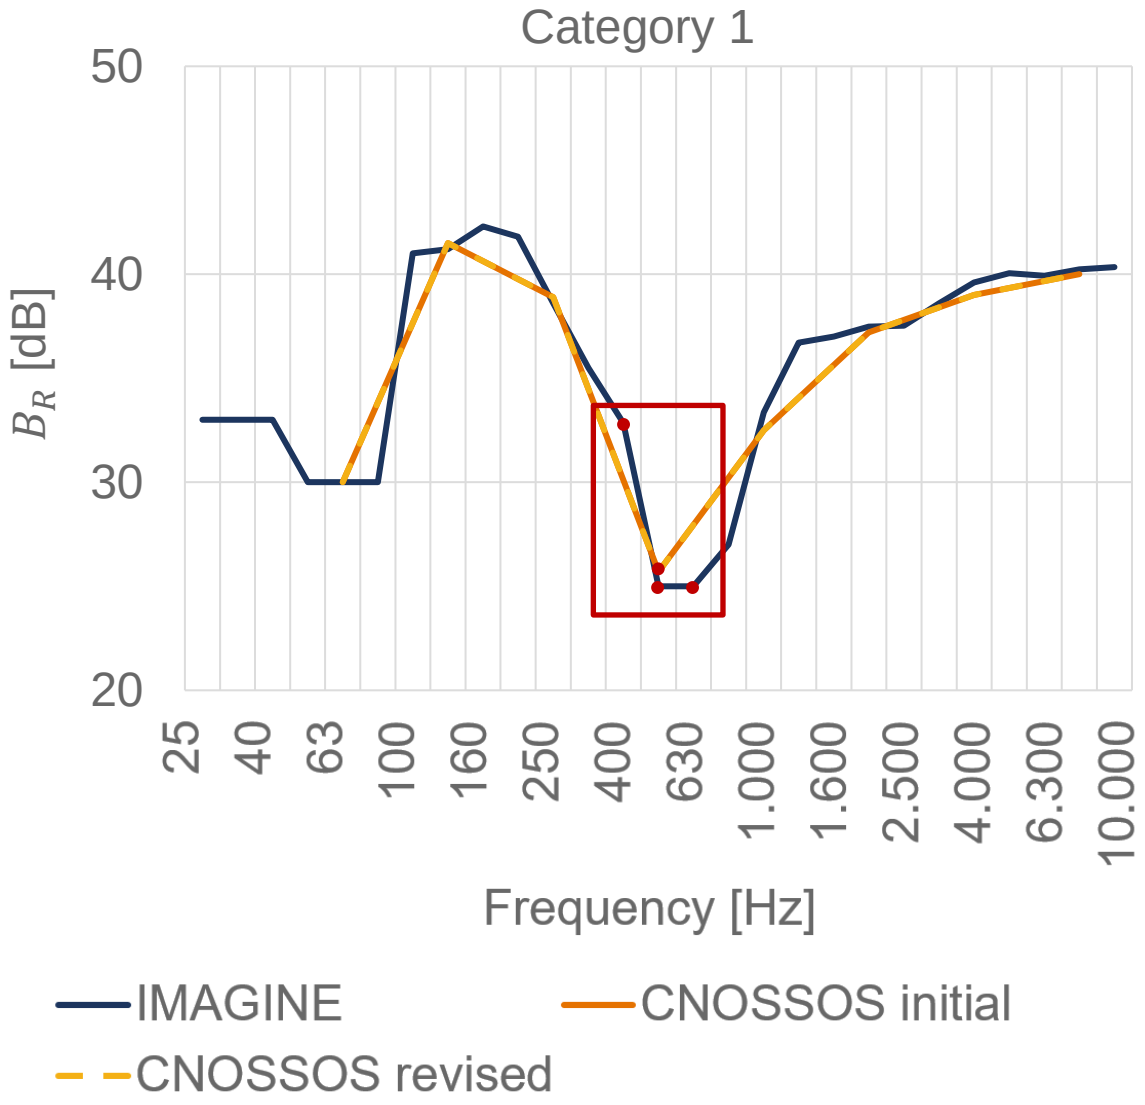
© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE

Sound power coefficients – Category 1 – Rolling noise – B_R

Coefficients [EUR15], [EUR21] & [IMA07b]

- Speed-dependent rolling coefficients
- Note: CNOSSOS octave and IMAGINE 1/3 octave
- Key messages:
  - High agreement of CNOSSOS and IMAGINE coefficients (fitting of IMAGINE data)



© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE
Sound power coefficients – Category 1 – Propulsion noise – A_P

Coefficients [EUR15], [EUR21] & [IMA07b]

- Speed-independent propulsion coefficients
- Note: CNOSSOS octave and IMAGINE 1/3 octave
- Key messages (Similar to A_R):
  - Summing the 1/3 octaves from IMAGINE results in the initial CNOSSOS coefficients
  - No deviation of 0.1 dB can be detected

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE

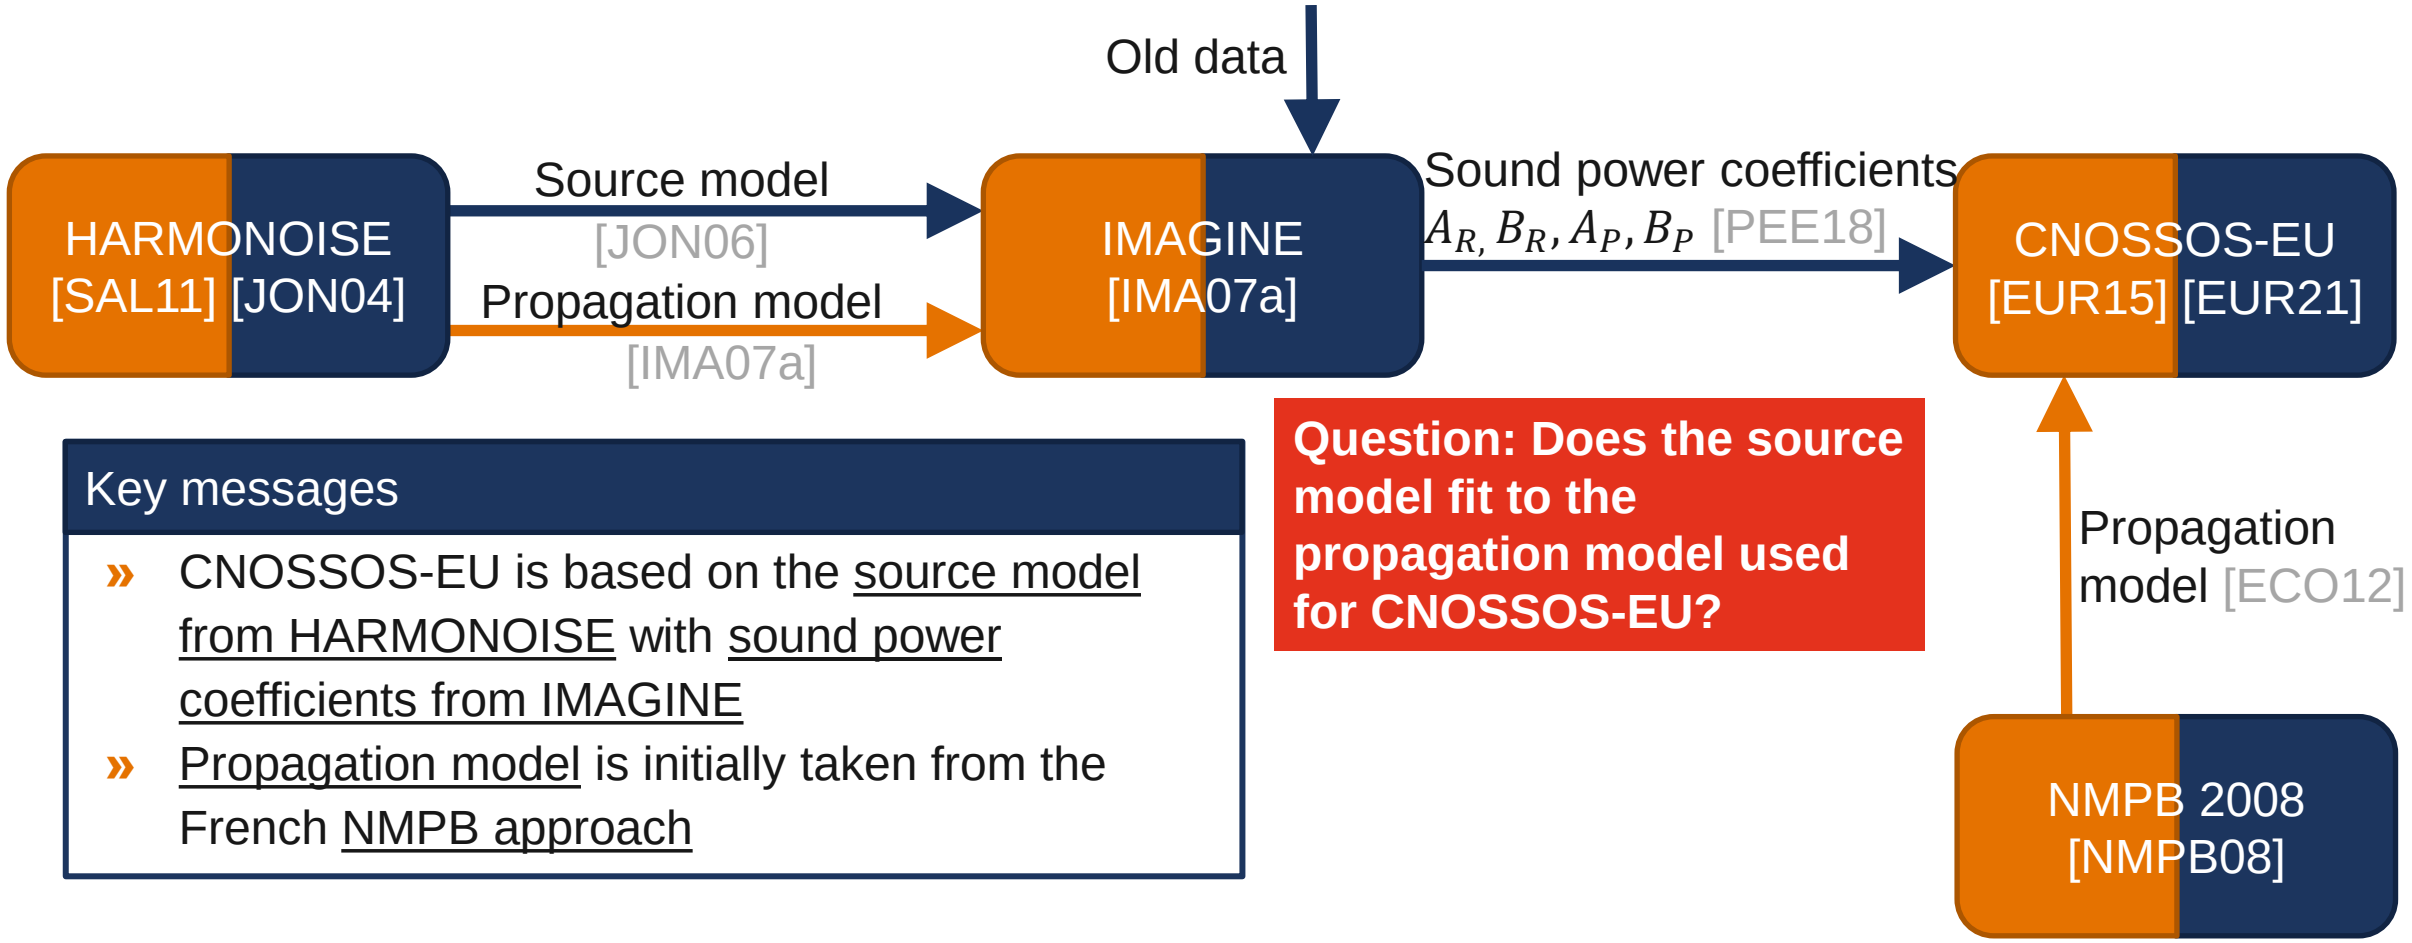
Reminder: Relations between models



Question: Does the source model fit to the propagation model used for CNOSSOS-EU?

Key messages

- CNOSSOS-EU is based on the source model from HARMONOISE with sound power coefficients from IMAGINE
- Propagation model is initially taken from the French NMPB approach

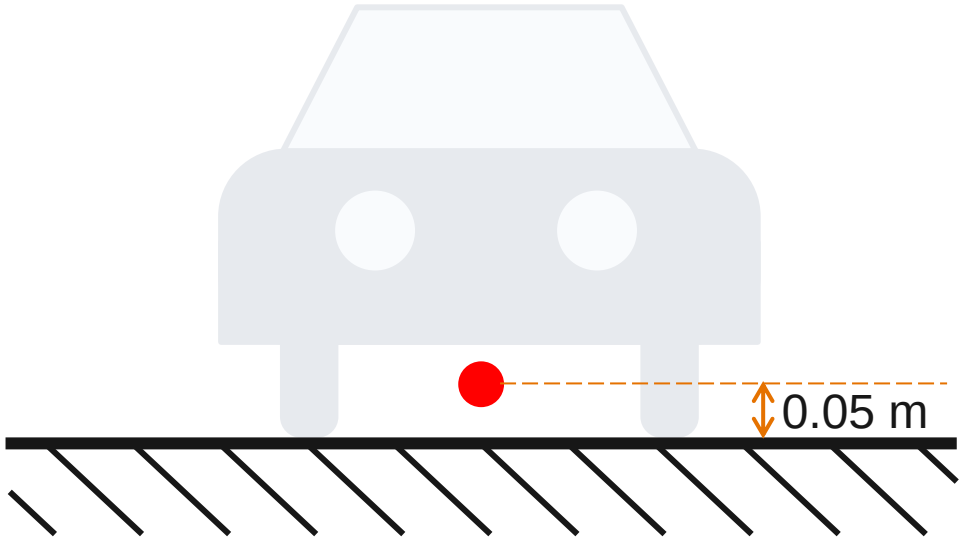
Source model Propagation model

© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE

Sound source modeling differences

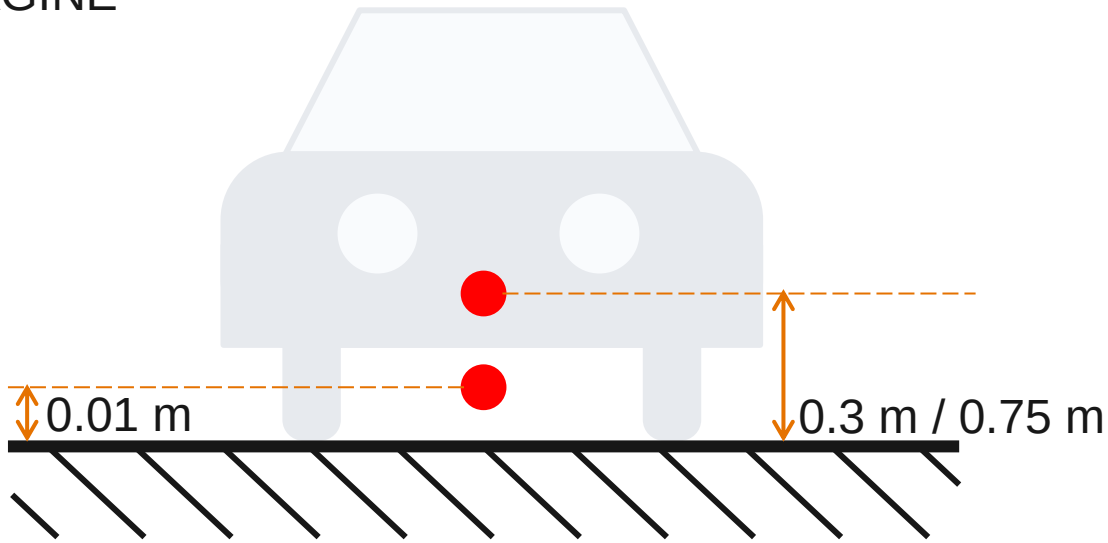
CNOSSOS-EU



CNOSSOS-EU source model

- One source at $h = 0.05$ m

HARMONOISE/
IMAGINE



HARMONOISE/IMAGINE source model

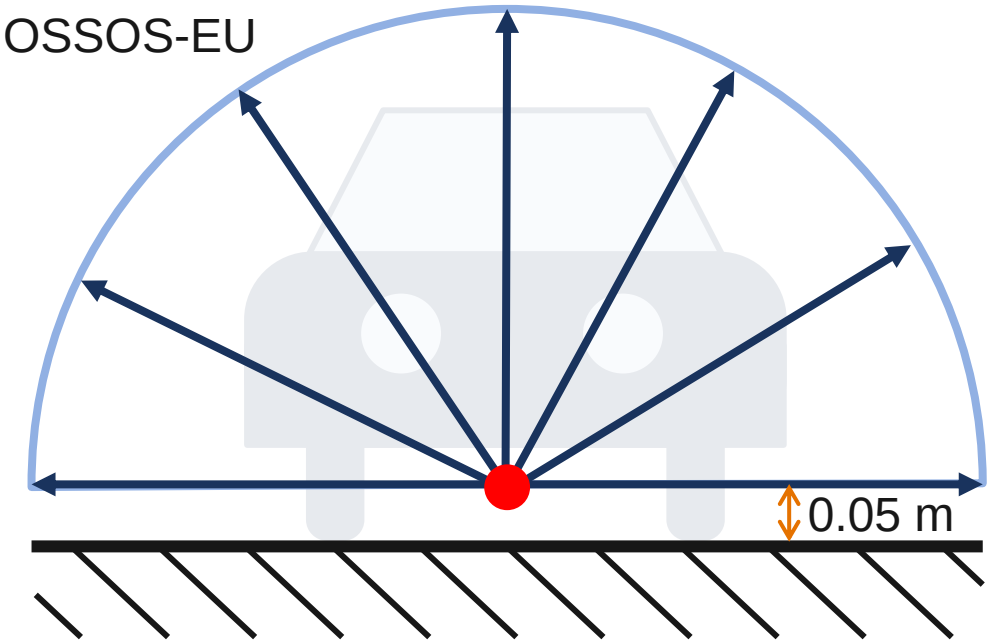
- Source position and quantity depends on vehicle category, e.g., for passenger cars:
  - One source at $h = 0.01$ m
  - One source at $h = 0.3$ m

© fka GmbH

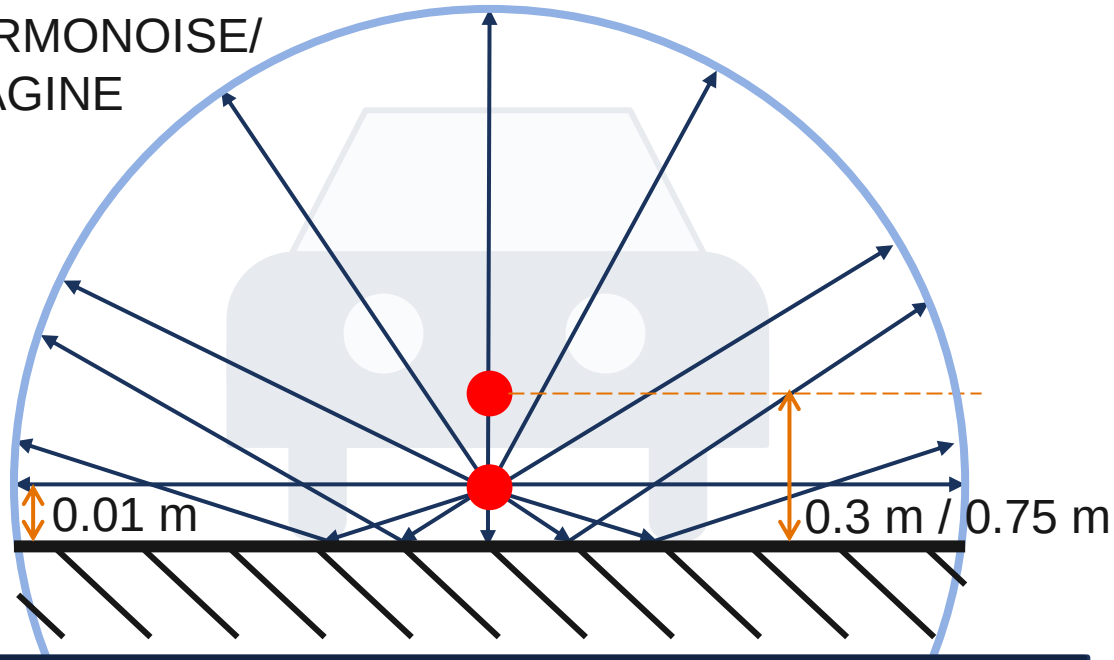
Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE

Sound propagation modeling differences

CNOSSOS-EU



HARMONOISE/
IMAGINE



CNOSSOS-EU propagation model (from NMPB)

- Reflection of road surface is included implicitly (hemispherical radiation → doubled sound power)
- Incoherent: $L_{sum} = 10 \cdot \log(10^{0.1 \cdot L_1} + 10^{0.1 \cdot L_2})$ [PEE18]

→ +3 dB for reflective surface without absorption

HARMONOISE/IMAGINE propagation model

- Free-field conditions radiating spherically
- Coherent: $L_{sum} = 20 \cdot \log\left(\frac{p_1 p_2}{p_0}\right)$ [VAN12]

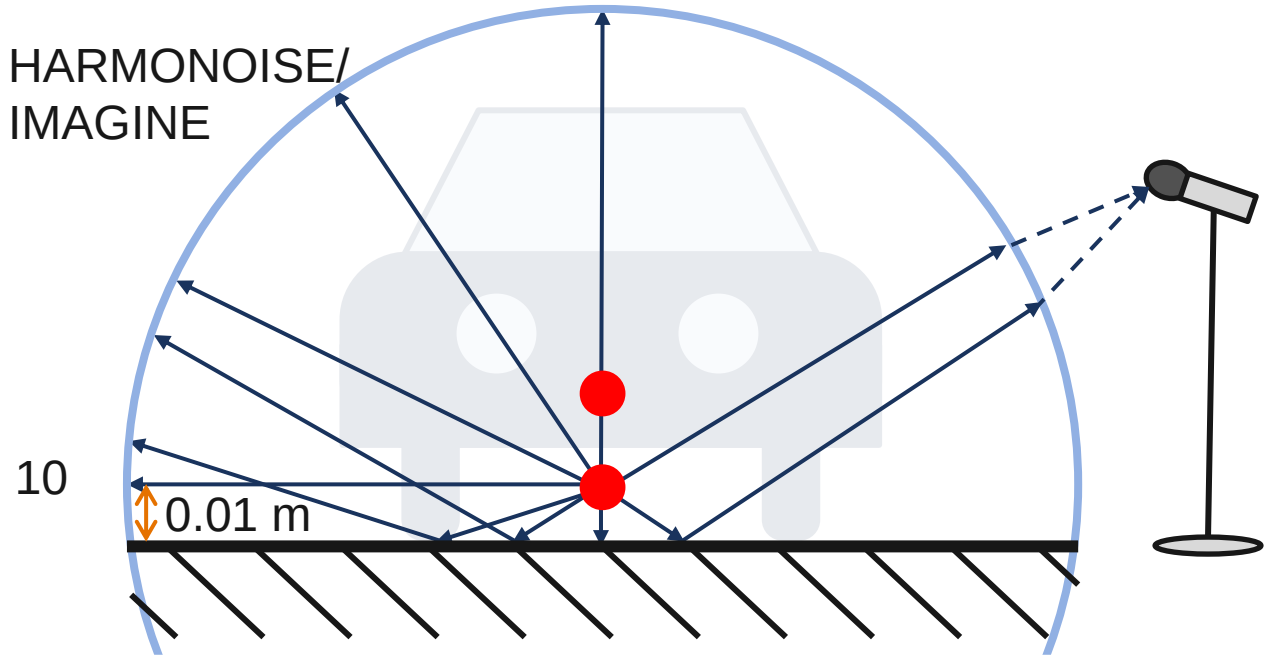
→ +6 dB for constructive interference

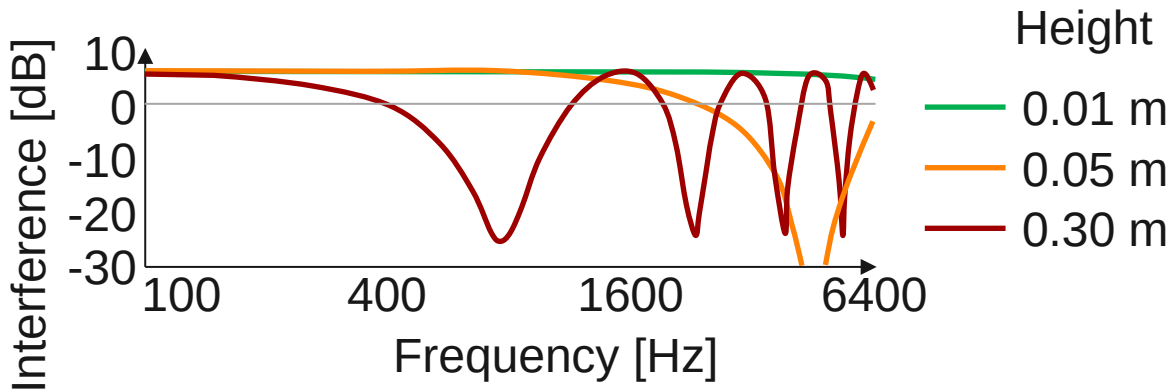
© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE
Sound propagation modeling differences

Estimation of sound power coefficients

- Sound power coefficients originate from measurement campaigns
- SPB measurements have been conducted
  - Source close to the road surface → Path difference neglected (see figure on the right)
  - Summation of coherent sounds → ≤ 6 dB
- This fact was well known in IMAGINE:
  1. "[…] interference between direct and reflected components are strongly affected by variation in source height" [IMA07a]
  2. "[…] accounted for by using a smeared out source position" [IMA07a]
  3. However: Direct and reflected added including their phase



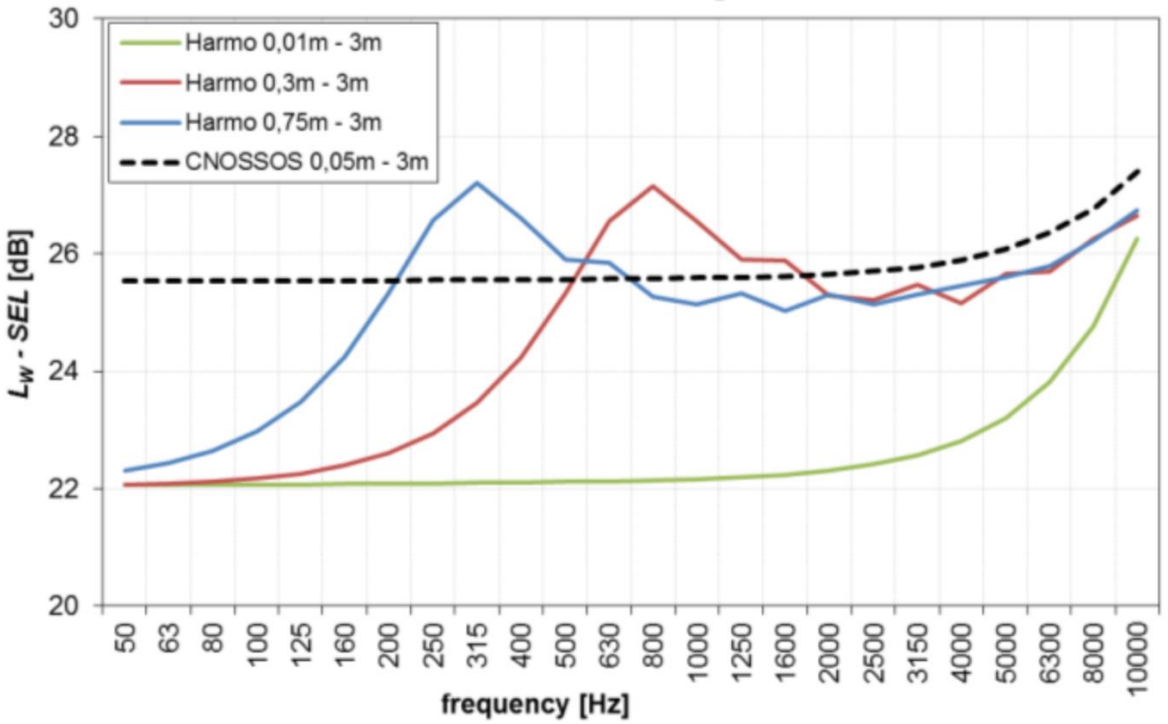


© fka GmbH

Propagation model change

- While taking the **source model** description from the **HARMONOISE/ IMAGINE** project, the **propagation model** was chosen to be the French **NMPB 2008** provisionally [KEP14]
  - Differences in the transfer functions (resulting from the propagation model) for **HARMONOISE** and **CNOSSOS-EU** can be seen on the right
  - Distinctions in the source model between **CNOSSOS-EU** and **IMAGINE** shown on **slide 20-23 and slide 88**

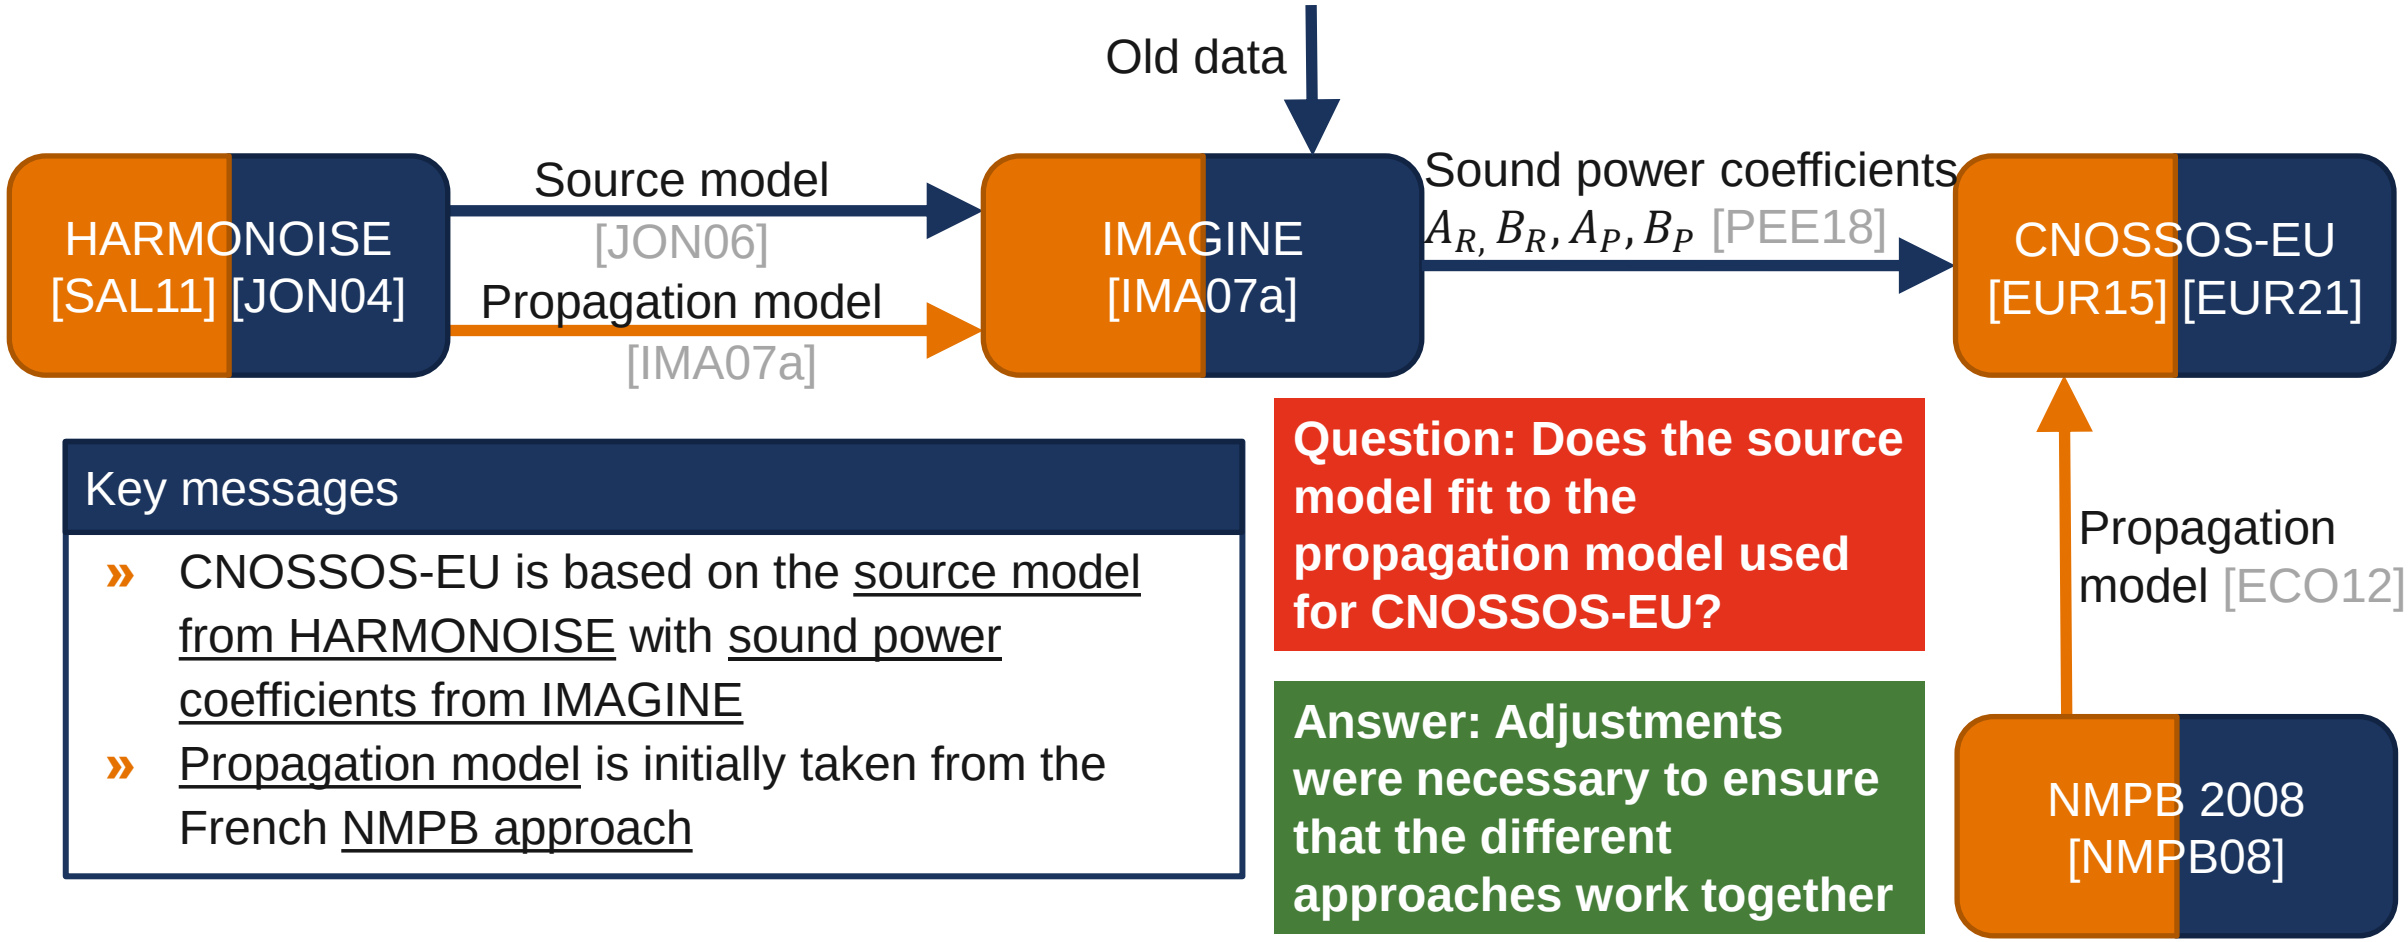
Transfer functions from L_W to SEL for $v_{ref} = 70\,\frac{\mathrm{km}}{\mathrm{h}}$ [PEE18]



© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE

Reminder: Relations between models



Key messages

- CNOSSOS-EU is based on the source model from HARMONOISE with sound power coefficients from IMAGINE
- Propagation model is initially taken from the French NMPB approach

Question: Does the source model fit to the propagation model used for CNOSSOS-EU?

Answer: Adjustments were necessary to ensure that the different approaches work together

These adjustments were not performed for the initial coefficients in [EUR15] and therefore needed for be done for the revision in 2021.

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE
CNOSSOS-EU Revision – Procedure [PEE18]

Procedure for revised CNOSSOS-EU coefficients

- The procedure for the updated CNOSSOS-EU coefficients is presented in [PEE18]

- It is based on
  - „old“ coefficients from 2015
  - Transfer functions (TFs) from the HARMONOISE/ IMAGINE propagation model
    - TFs: calculated difference between L_W at the source and SEL at the receiver
    - With are three different TFs depending on the different source heights
  - Transfer function (TF) from CNOSSOS-EU sound propagation model

Approach (short summary)

1. The 2015 coefficients and the HARMONOISE/ IMAGINE transfer functions are used to calculate the sound exposure level (SEL on a hypothetical microphone position
   a. For rolling as well as for propulsion noise
   b. For each vehicle category

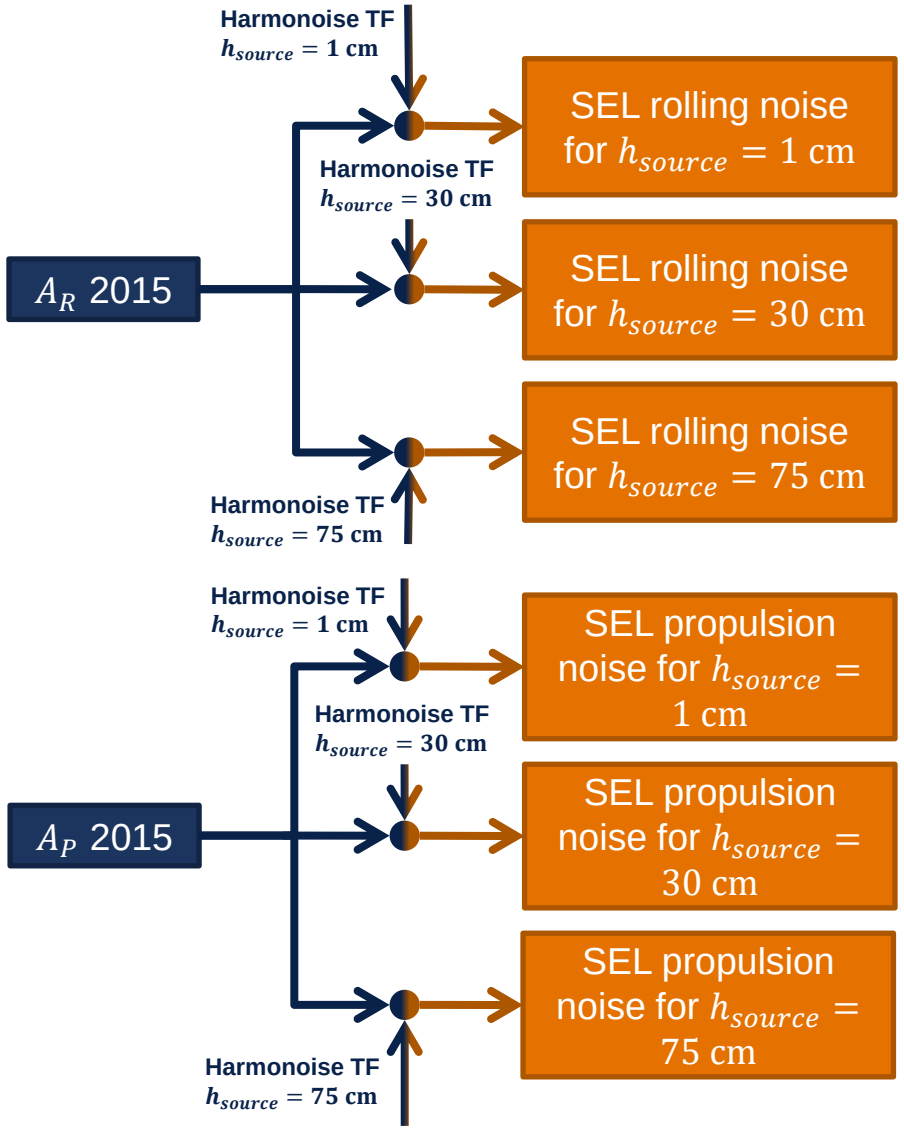
2. The CNOSSOS-EU TF is applied and by using the contributions of rolling and propulsion noise the revised coefficients are calculated

- This means that no additional measurements were performed for the revision

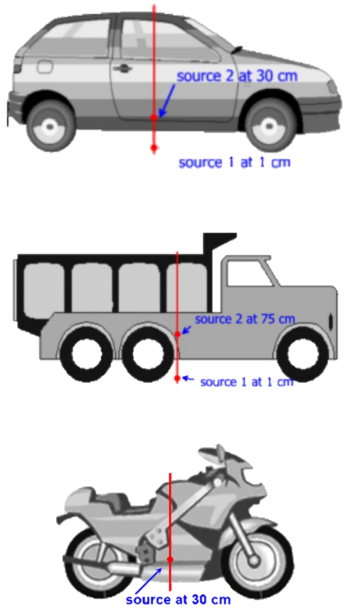
© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE

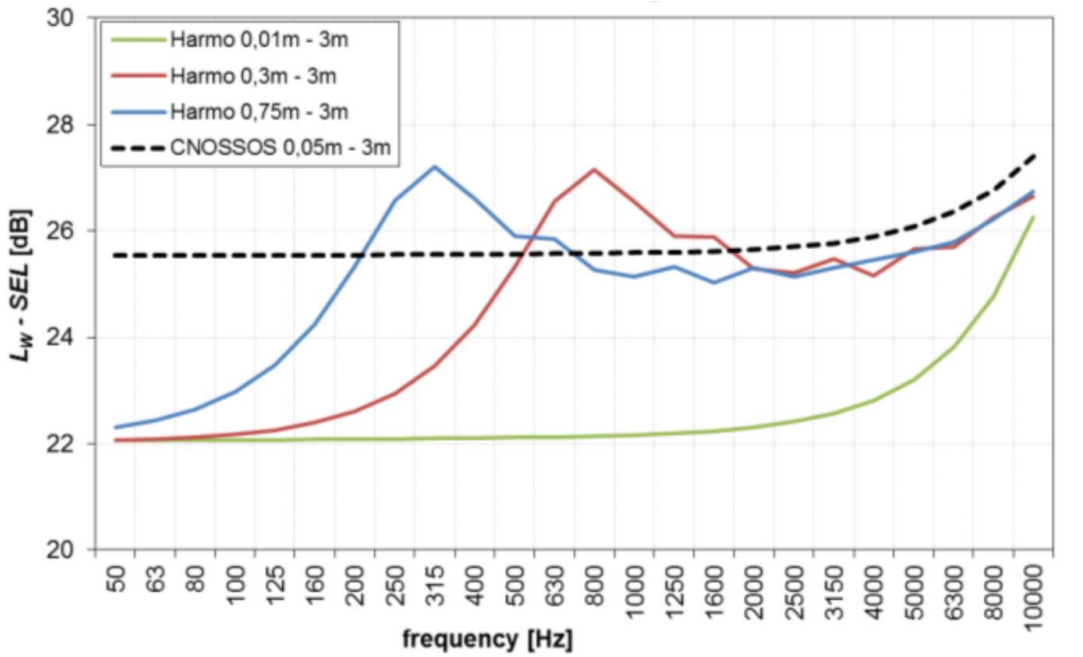
CNOSSOS-EU Revision – Procedure [PEE18]



The initial coefficients (divided into rolling and propulsion) were used to calculate SELs at the different source heights defined in HARMONOISE



Transfer functions from $L_{W,source}$ to $SEL_{receiver}$ [IMA07a]



Source position | Receiver position

CNOSSOS-EU Revision – Procedure [PEE18]

© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE

CNOSSOS-EU Revision – Procedure [PEE18]

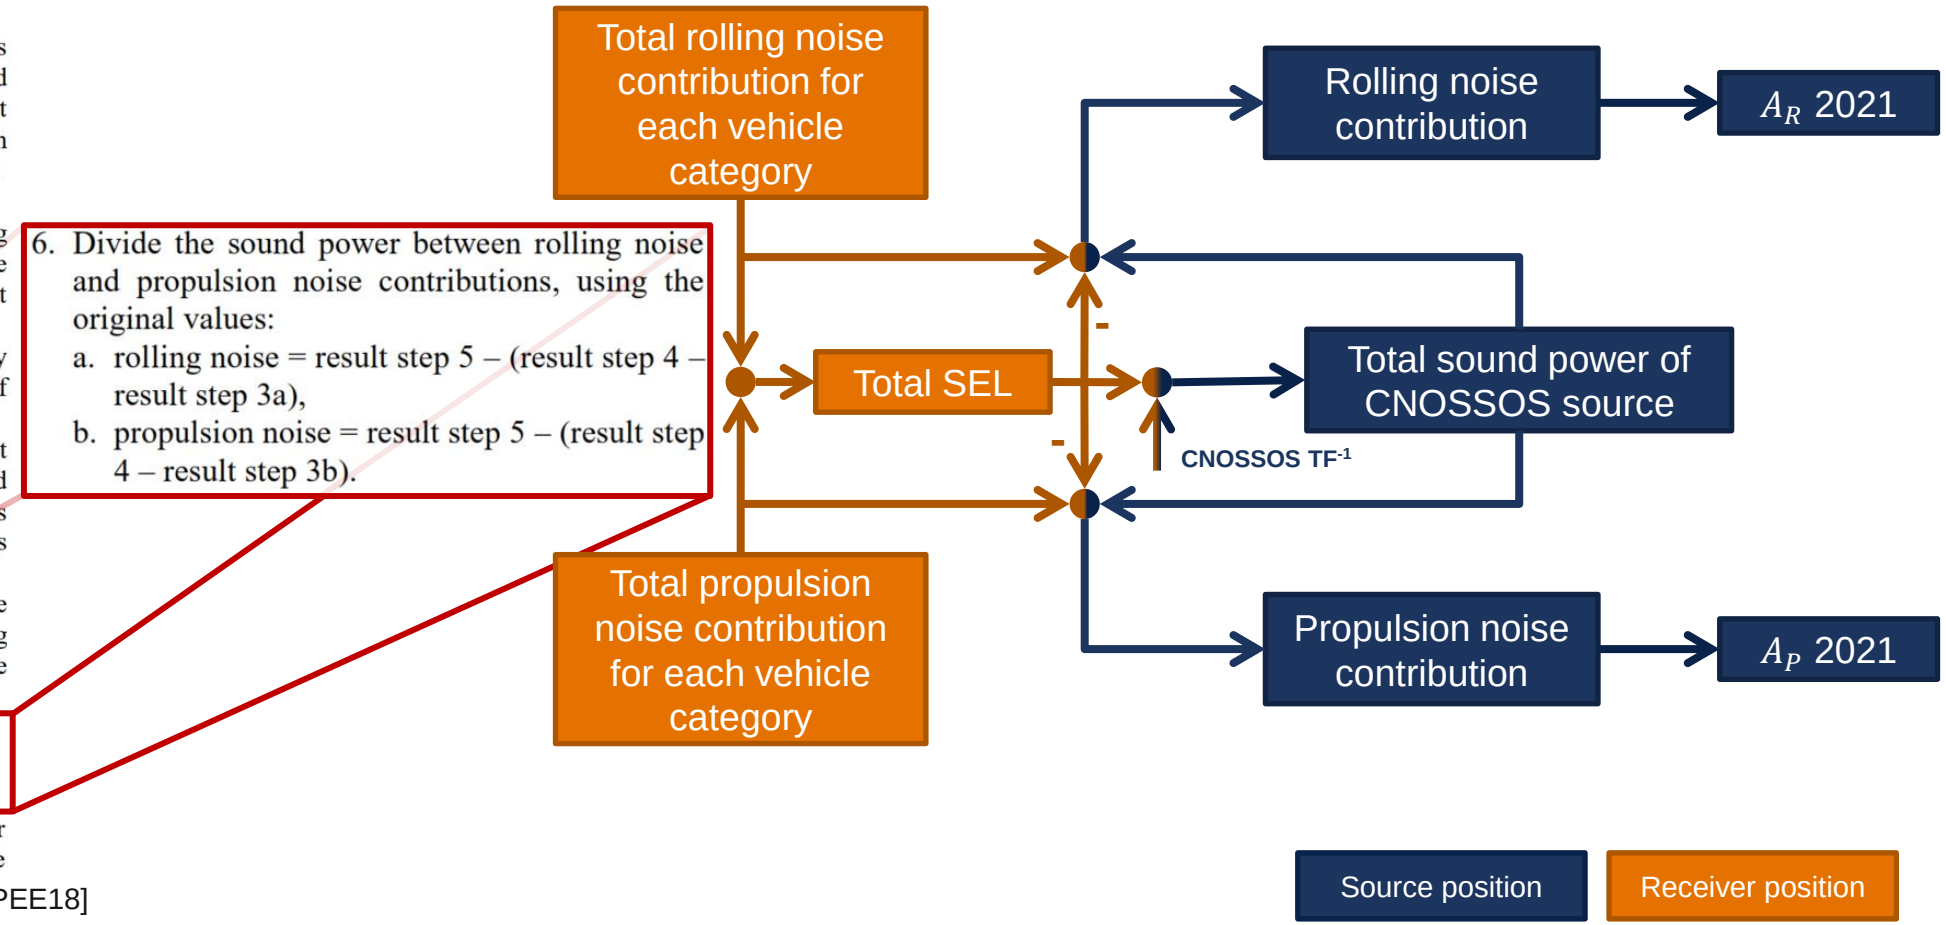
To correct the CNOSSOS sound power coefficients for the change in propagation models, we follow the following procedure:

1. Start with the IMAGINE A_R and A_P coefficients, which are equal to the Directive 2015/996 Table F-1 values, but in 1/3-octave bands.
2. Using the Harmonoise transfer functions, as shown in Figure 6, calculate the rolling and propulsion noise SEL levels at the measurement position (7.5 m distance, 3.0 m height), for each of the IMAGINE source heights (1, 30, 75 cm).
3. For each vehicle category, calculate
   a. the total rolling noise contribution, by adding 80% of the sound energy at the lowest source (1 cm) and 20% of the energy at the highest source (30 or 75 cm), and
   b. the total propulsion noise contribution, by adding 20% of the lowest source and 80% of the highest source.
4. Calculate the total SEL at the measurement position by adding the rolling noise and propulsion noise from 3a and 3b. These levels are exactly equal to the average SEL levels found from the measurements.
5. Calculate the total sound power for the CNOSSOS sound source at 5 cm height, using the transfer functions calculated with the CNOSSOS propagation model (see Table I).
6. Divide the sound power between rolling noise and propulsion noise contributions, using the original values:
   a. rolling noise = result step 5 – (result step 4 – result step 3a),
   b. propulsion noise = result step 5 – (result step 4 – result step 3b).
7. Calculate the CNOSSOS-EU coefficients for rolling and propulsion noise by summing the 1/3-octave band values to 1/1-octave bands.

[PEE18]



© fka GmbH

Detailed Analysis on CNOSSOS-EU & HARMONOISE/ IMAGINE

CNOSSOS-EU Revision – Procedure [PEE18]

For obtaining the rolling/ propulsion noise contribution, the vise versa contribution needs to be subtracted from of overall sound power, meaning:

- **Rolling contribution = total sound power – propulsion contribution**
- **Propulsion contribution = total sound power – rolling contribution**

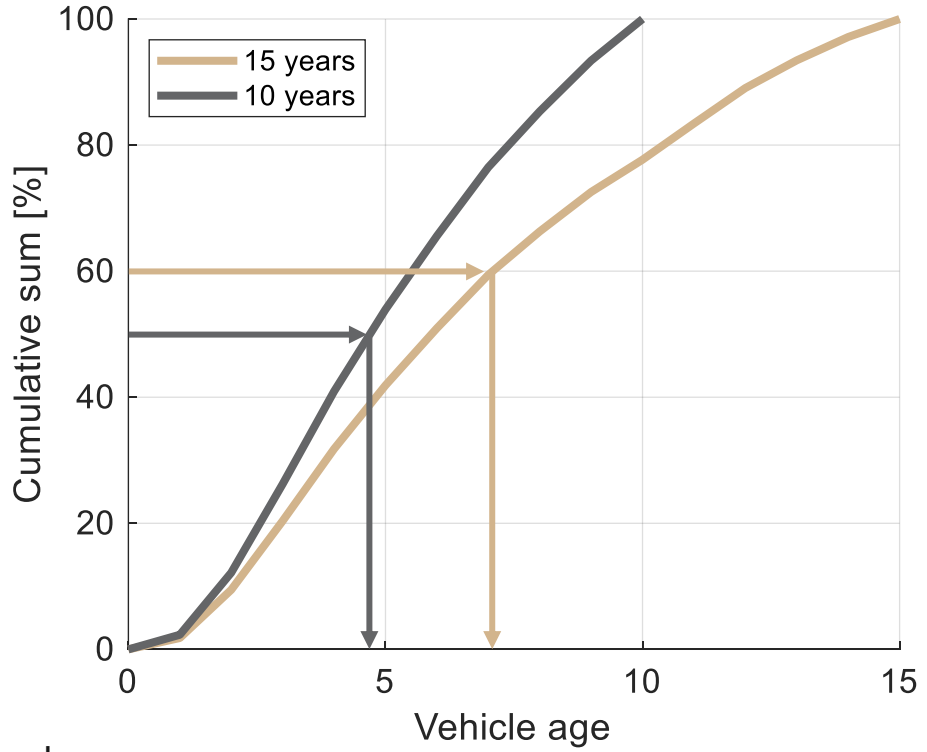
Vehicle fleet comparison

- From [STE05] an extraction from a vehicle fleet composition is possible based on the definition of a maximum vehicle age
- For the following, two maximum vehicle ages are defined (for two different scenarios), namely
  - 10 years
  - 15 years
- The cumulative composition can be seen in the figure on the right
  - This is a fleet composition based on measurements in 2001/2002

Vehicle fleet composition obtained from [STE05]



Examples

- 10 year span: 50% of the vehicles are up to 4.8 years old
- 15 year span: 60% of the vehicles are up to 7 years old

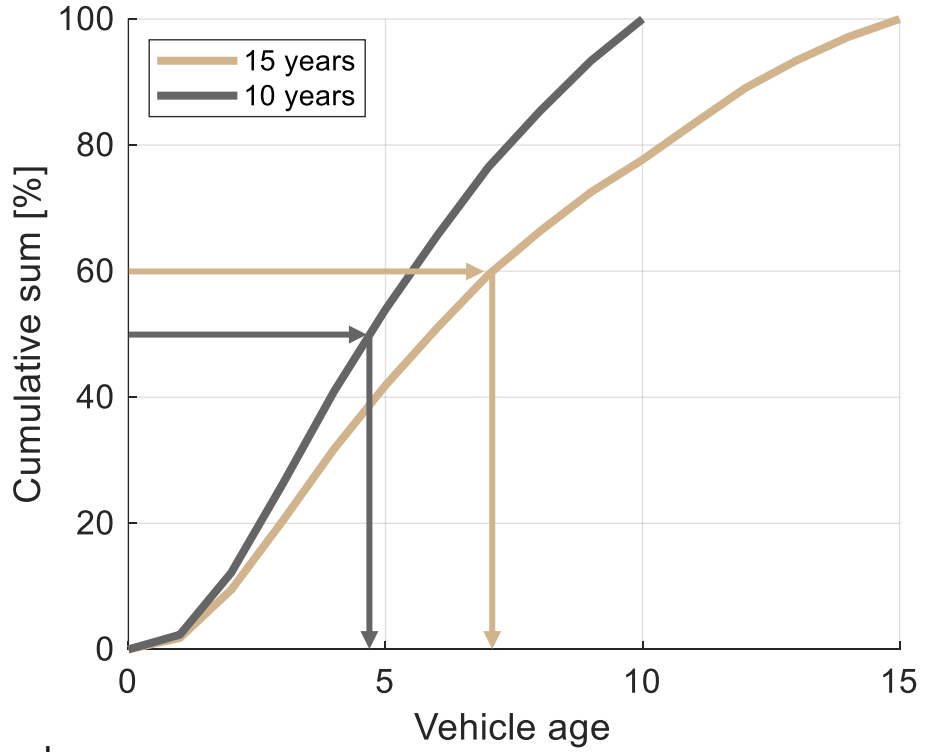
© fka GmbH

Relevant vehicle parameters regarding sound emission
Overall Sound Level

Vehicle fleet comparison

- This fleet composition can be taken as a basis to compare the data provided in [STE05] with those from [ATE22]
- Those two different fleet compositions (10 years and 15 years) are applied to the data shown before on the next slides

Vehicle fleet composition obtained from [STE05]



Examples

Contribution of rolling and propulsion noise

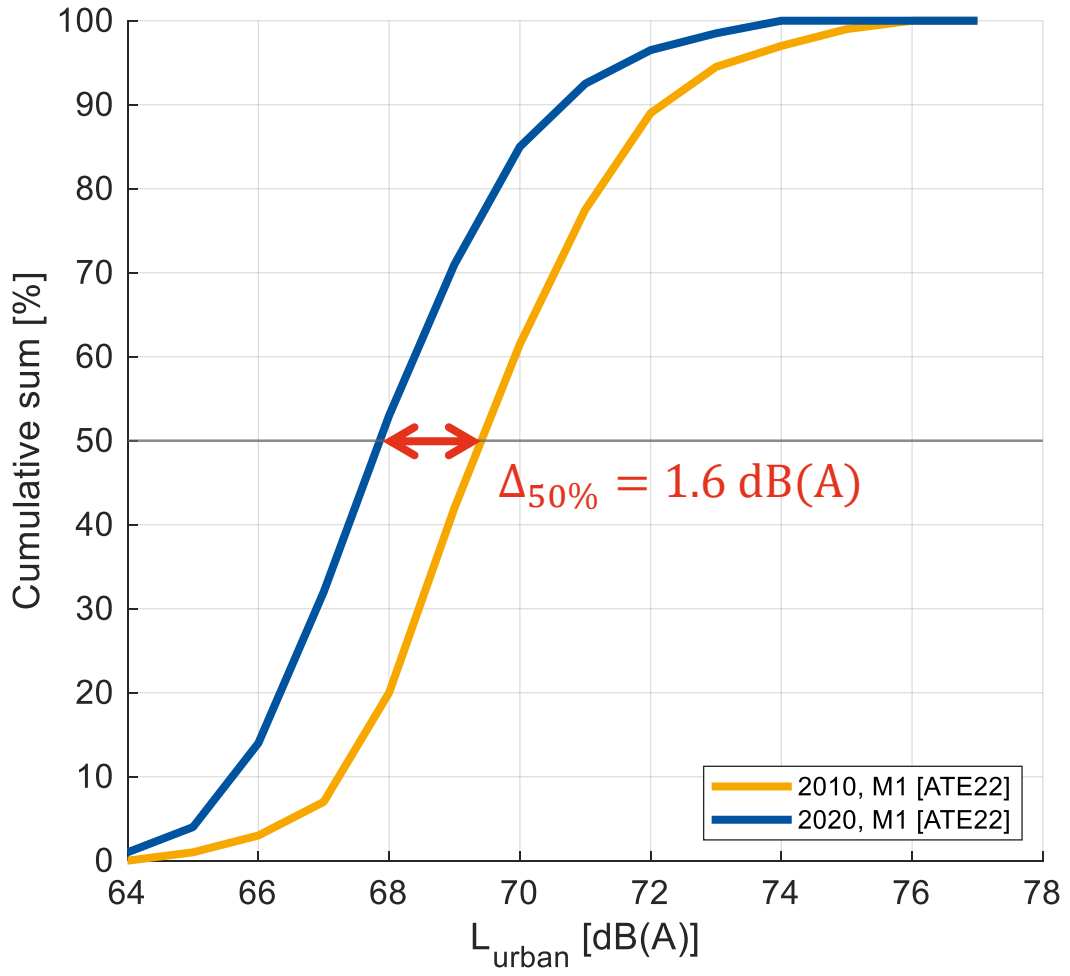
Statistical distribution of L_{urban}



General information

- In [ATE22], TA data of 2010 and 2020 are compared
- The graph left shows the distribution of TA values (L_{urban}) for 2010 and 2020 cumulatively
- Examples:
  - 2010 (orange): 50% of the vehicles had an L_{urban} of ~69.6 dB(A) or less
  - 2020 (blue): 50% of the vehicles had an L_{urban} of ~68 dB(A) or less
- Reduction in L_{urban} from 2010 to 2020 of 1.6 dB(A)

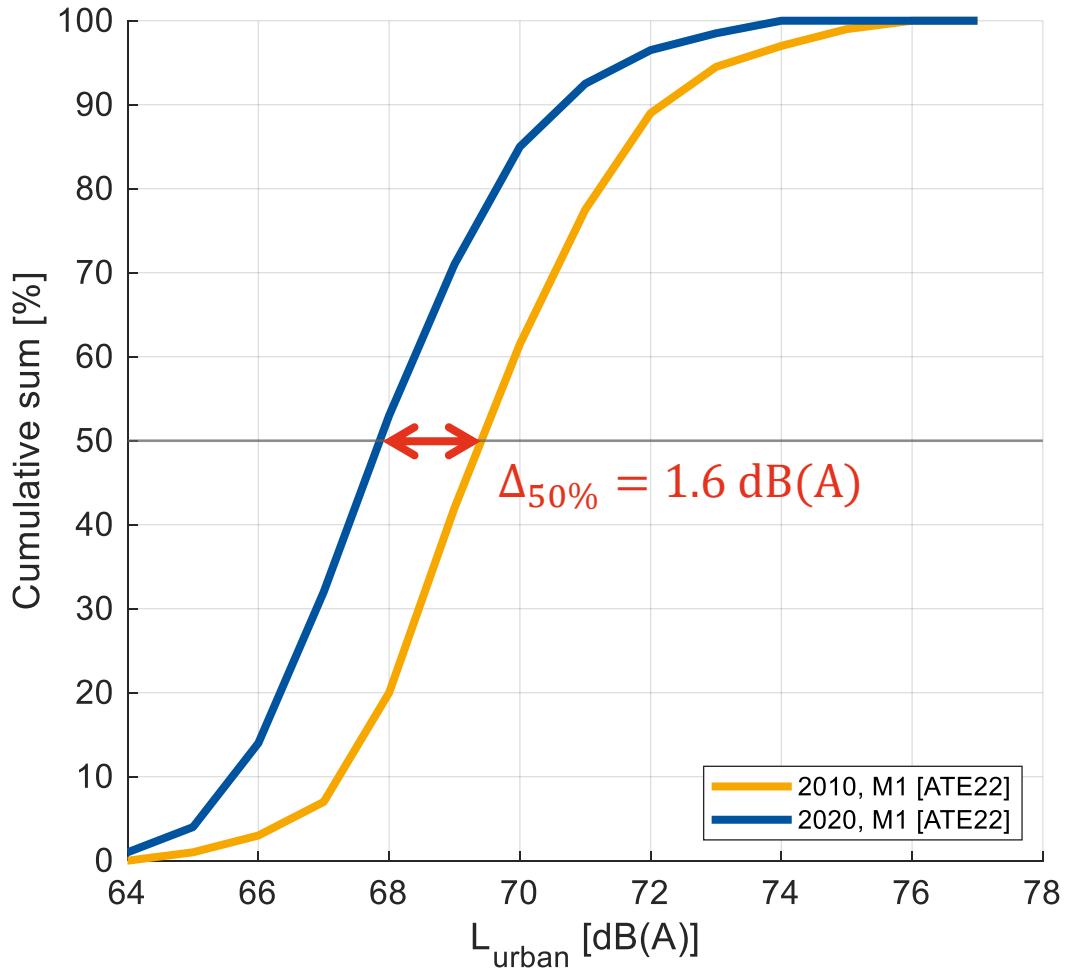
Contribution of rolling and propulsion noise

Statistical distribution of L_{urban}



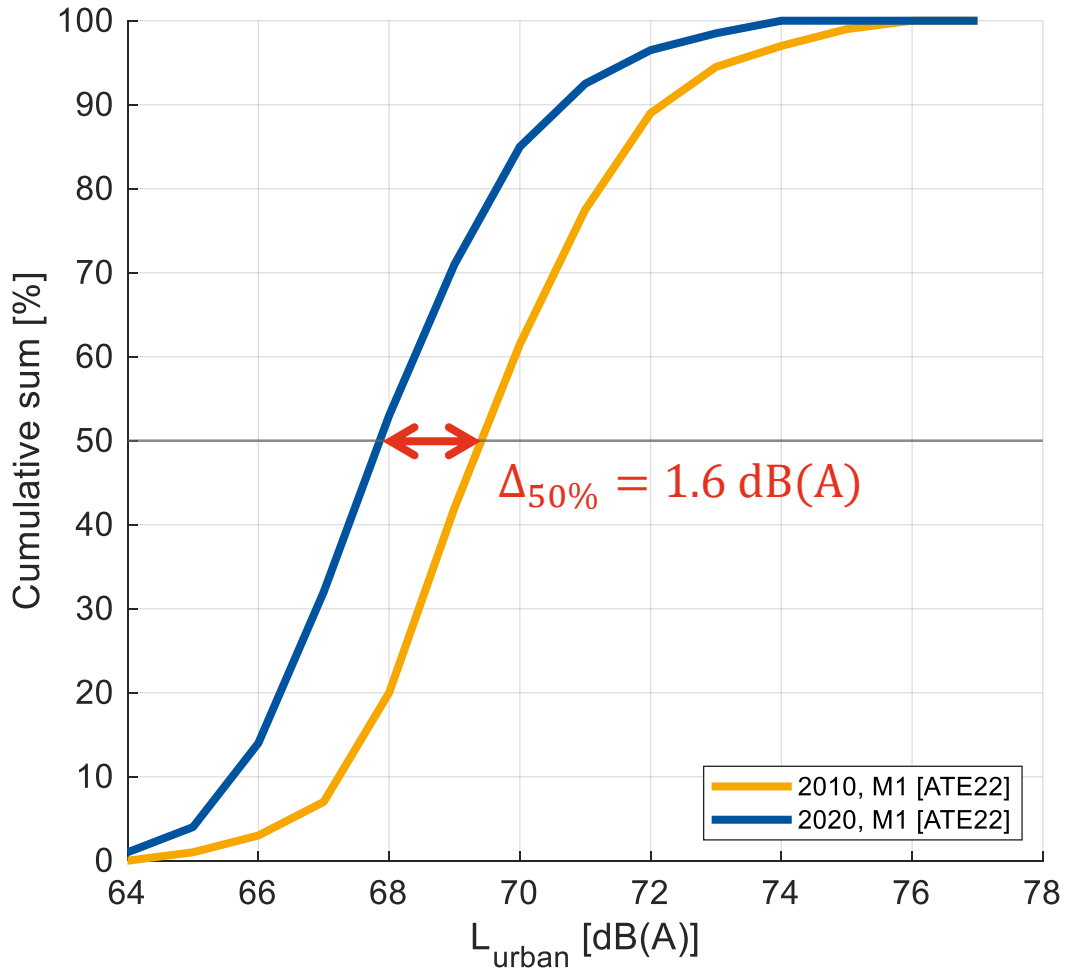
General information

- In [ATE22], TA data of 2010 and 2020 are compared
- The graph left shows the distribution of TA values (L_{urban}) for 2010 and 2020 cumulatively
- L_{urban} results from a vehicle dependent factor (k_p) as well as constant (L_{crs}) and accelerated (L_{wot}) pass by measurements
  - $L_{urban} = L_{wot\,rep} - k_p\left(L_{wot\,rep} - L_{crs\,rep}\right)$
- Reduction in L_{urban} from 2010 to 2020 of 1.6 dB(A) (median [1.553] and mean [1.559] value)

© fka GmbH

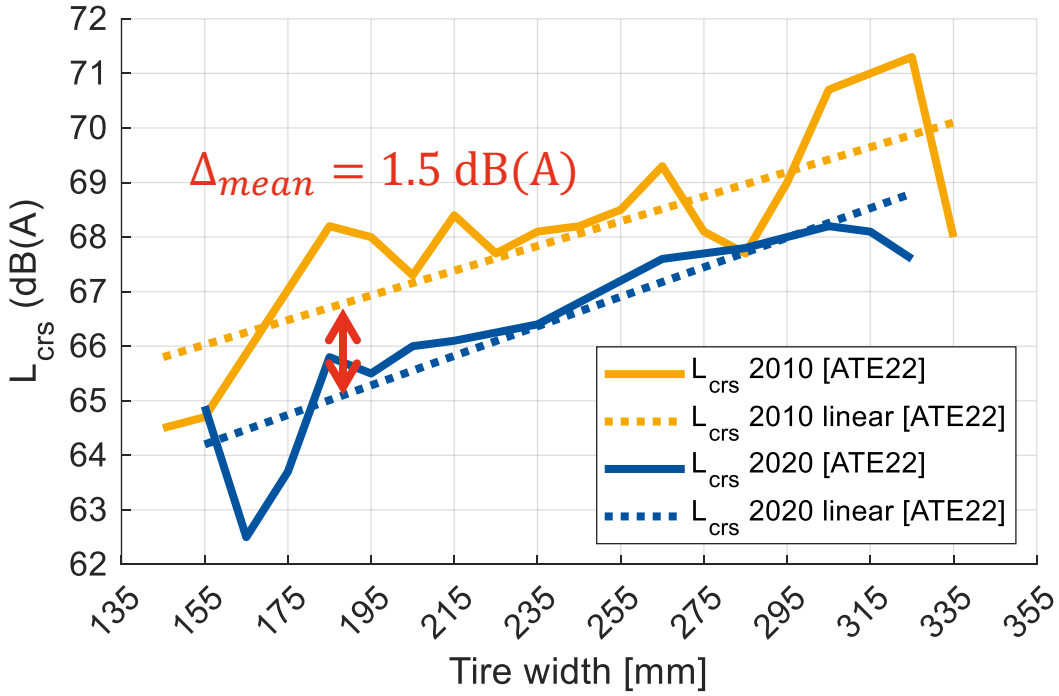
Relevant vehicle parameters regarding sound emission
Contribution of rolling and propulsion noise

Statistical distribution of L_{urban}



Investigation on L_{crs} (rolling noise)

» 90% of L_{crs} is rolling noise [ATE22]

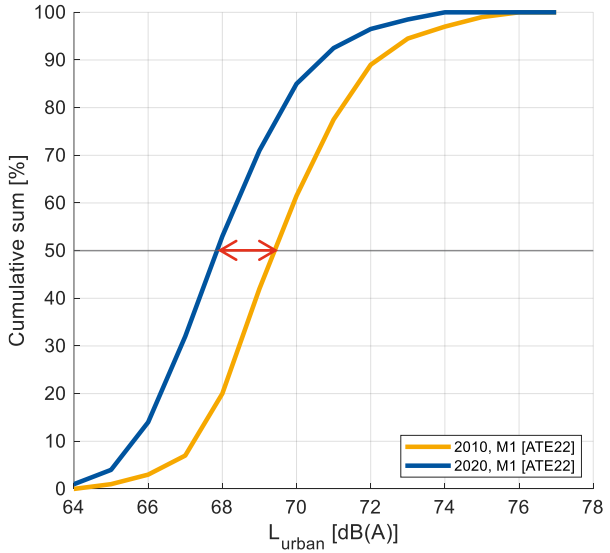


© fka GmbH

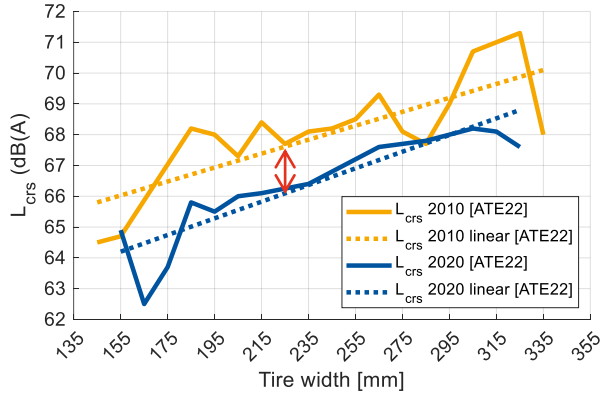
Relevant vehicle parameters regarding sound emission
Contribution of rolling and propulsion noise

Reductions from 2010 to 2020

» **1.6 dB(A) for L_{urban}**



» **1.5 dB(A) for L_{crs} (of which is 90 % rolling noise)**



Calculation of L_{urban}

» $L_{urban} = L_{wot\,rep} - k_p\left(L_{wot\,rep} - L_{crs\,rep}\right)$

From 2010 to 2020

≈ -1.6 dB(A)

$k_p = f(PMR)$

Reduction inevitable

From 2010 to 2020

≈ -1.5 dB(A)

» **Indication** of an unchanged contribution

© fka GmbH

Relevant vehicle parameters regarding sound emission
Contribution of rolling and propulsion noise

Literature information

- In [SHI15]:
  - **Unchanged contribution** for rolling and propulsion noise is a good first estimate

> higher speeds, and that engine noise may be ignored for light vehicles in these situations. As a first estimate it may be worthwhile to assume that the split between rolling and propulsion noise is in the same ratio as in the default CNOSSOS-EU database, provided that the appropriate asphalt type is provisionally used in the formula to help avoid the new values being a combination of vehicle and asphalt type changes.

Calculation of L_{urban}

- $L_{urban} = L_{wot\,rep} - k_p\left(L_{wot\,rep} - L_{crs\,rep}\right)$

From 2010 to 2020: ≈ -1.6 dB(A)

$k_p = f(PMR)$

From 2010 to 2020: ≈ -1.5 dB(A)

Reduction inevitable

- **Indication** of an unchanged contribution
- **Note**: The presented results do not deal with the topic of old vs. new vehicle fleets regarding the overall level (→ see meeting presentation no.10)

Relevant vehicle parameters regarding sound emission
Frequency spectrum

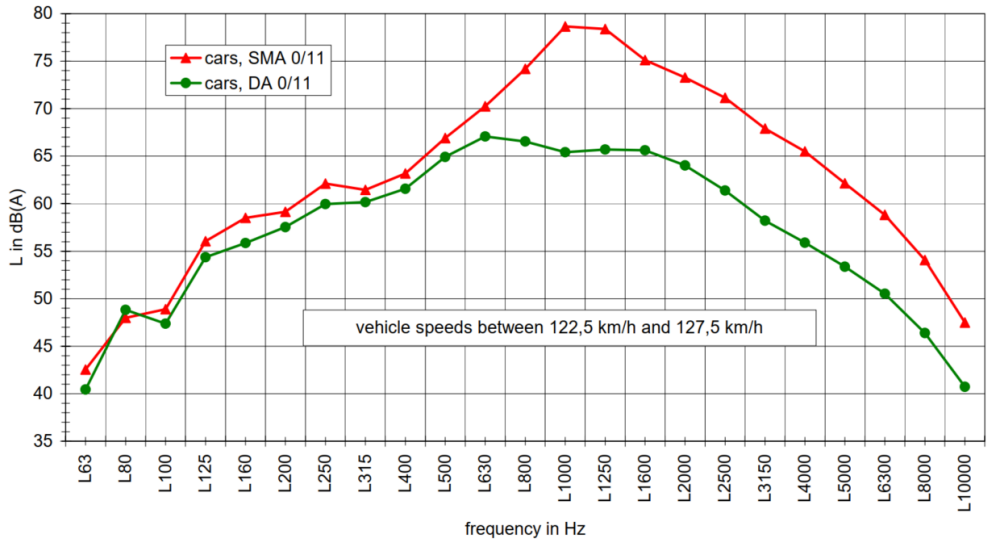
Investigations in [STE05]

- In [STE05], **frequency spectrums on motorways** are investigated
  - e.g. averaged frequency distribution [STE05]:



- Frequency data for other types of roads is also unavailable in [STE05]

General information

- **Not enough data available** for an investigation of possible changes in the frequency spectrum of pass by vehicles

- A reasonable first assumption could be that the **frequency distribution remains unchanged** when considering the same sources (ICE & tire-road noise) due to the lack of data
  - This could be investigated in an extensive EU project for updating the coefficients

Possibilities for integrating sound emission changes
CNOSSOS-EU Category extension

Literature review on [SHI15] & [DEV]

- A procedure is described on how to adapt/extent the vehicle categories:
  - Category ID (≥5)
  - Description
  - Rolling noise (yes/no)
  - Propulsion noise (yes/no)
  - Corrections (Studded tires, air temperature, gradient)
  - Speed variations
  - Coefficients for acceleration $C_{r,k}$ & $C_{p,k}$
  - Coefficients $A_{R,i,m}$, $B_{R,i,m}$, $A_{P,i,m}$ & $B_{P,i,m}$

Cat.	Name
1	Light motor vehicles
2	Medium heavy vehicles
3	Heavy vehicles
4	Powered two-wheelers
5	Open category
…	New categories

Possibilities for integrating sound emission changes
Determination of new coefficients

General information [SHI15] [DEV] [IMA07a]

- Required measurements: Vehicle pass-by as conducted by TNO / within IMAGINE
  - Sound emission levels (SEL)
- There is no standardized method on the derivation of the coefficients
- However, a procedure is presented in [SHI15] [DEV]
  - General driving conditions:
    - Constant speed (multiple speeds)
    - Accelerating/decelerating
    - Uphill/downhill
  - SPB Measurements (information on SPB from **slide 45-47 and 147-155**)

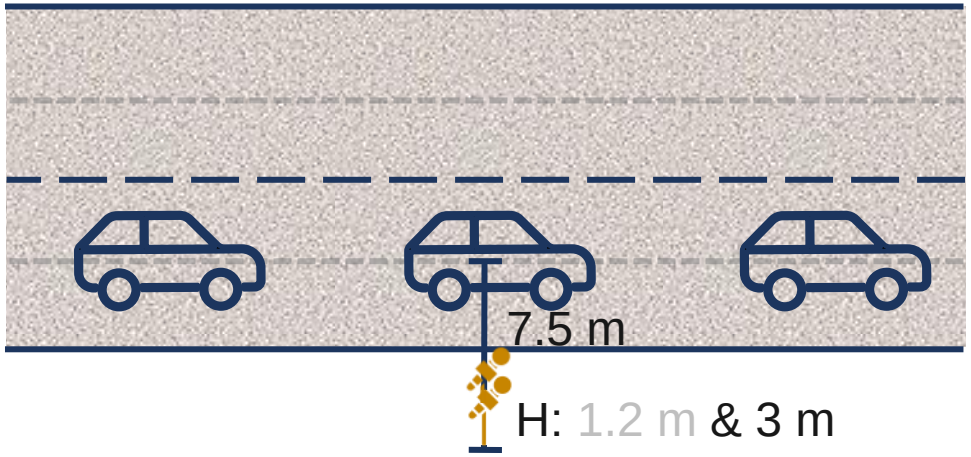
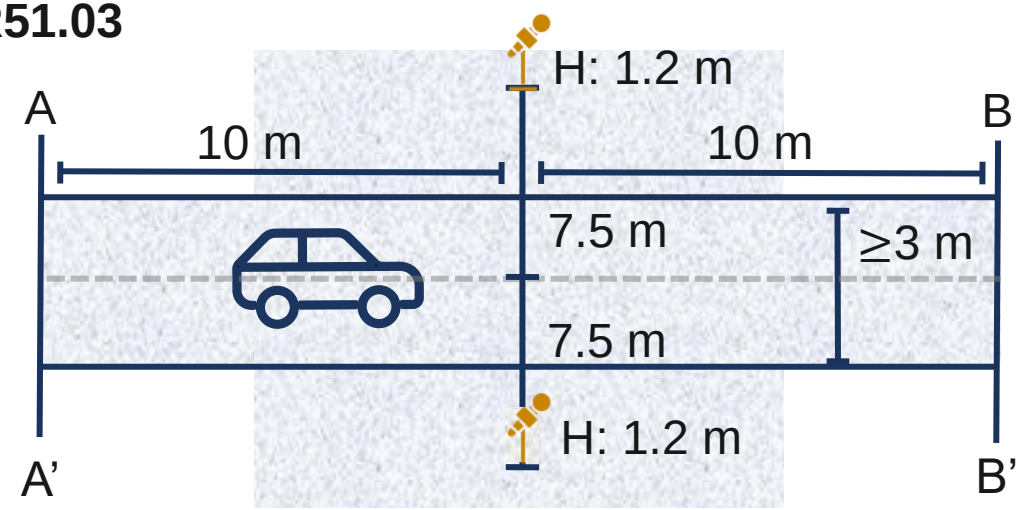
New coefficients from type approval data

SPB in IMAGINE based on ISO 11819-1



R51.03



Procedure for new coefficients

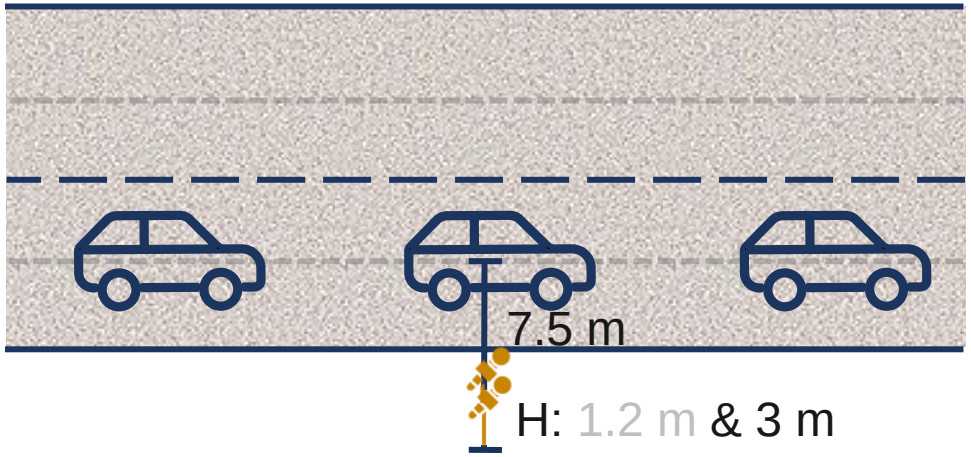
Background:

- Technical progress and changes in legislation are not considered in the coefficients
  - Current coefficients are derived among other things from SPB measurements
- Currently, no procedure for deriving new CNOSSOS-EU coefficients exists
  - Conducting new SPB measurements is not resource-efficient and the issue remains for the future
- Information about the technical progress and changes in legislation are available from type approval measurements

© fka GmbH

Possibilities for integrating sound emission changes
New coefficients from type approval data

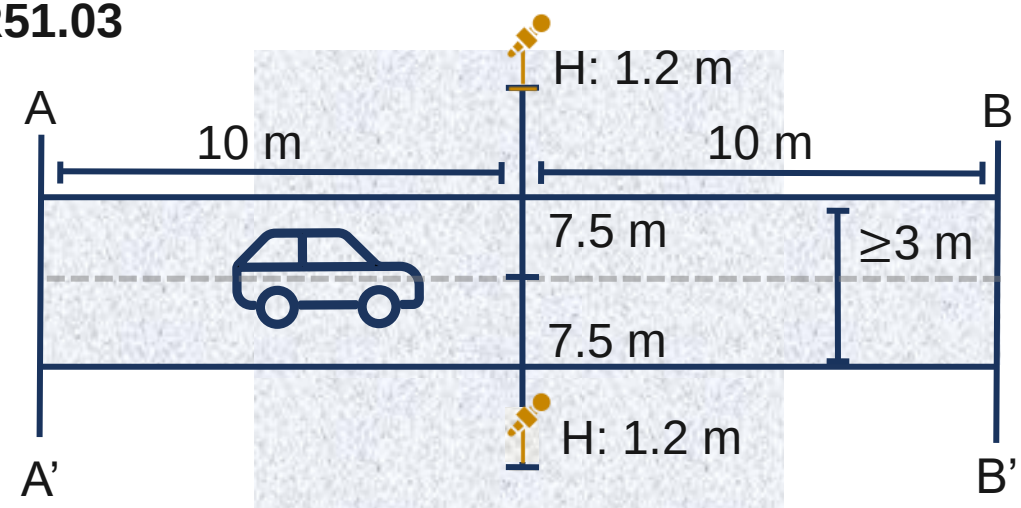
SPB in IMAGINE based on ISO 11819-1



Advantage of SPB-based procedure for derivation of sound power coefficients:

- Measurements of **real traffic/driving conditions**

R51.03



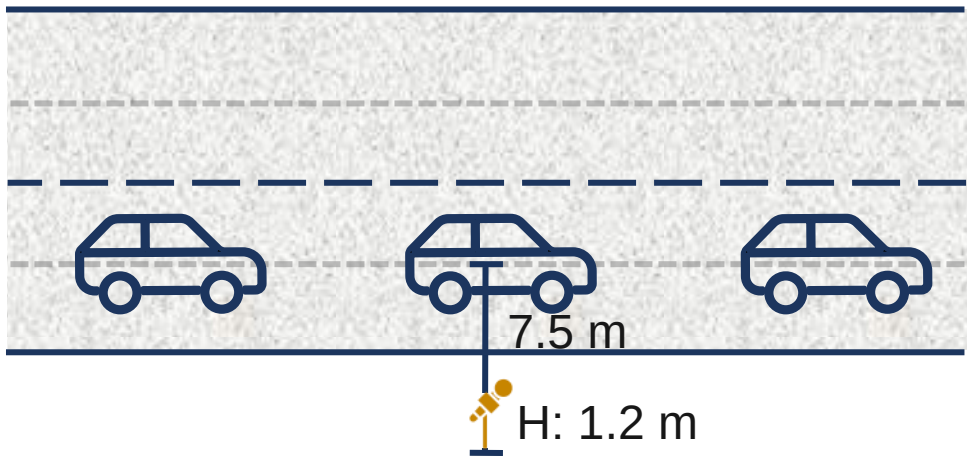
Advantage of TA-based procedure for derivation of sound power coefficients:

- **Availability of TA data** without additional measurements
- **Easy updating** of coefficients for new vehicles
- **No/minimal influence** from **track** selection
- High **repeatability/reproducibility**

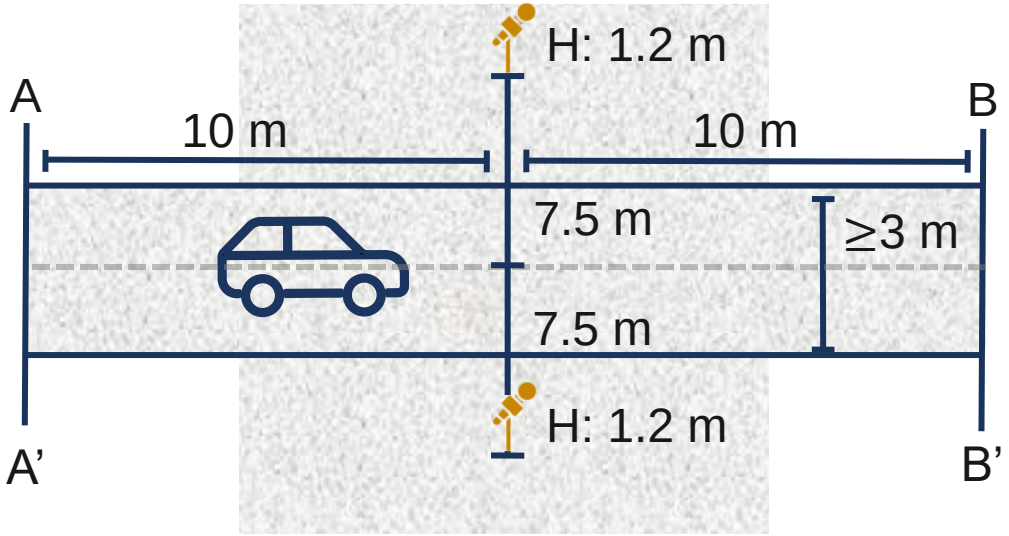
© fka GmbH

Possibilities for integrating sound emission changes
New coefficients from type approval data

SPB (ISO 11819-1)



R51.03



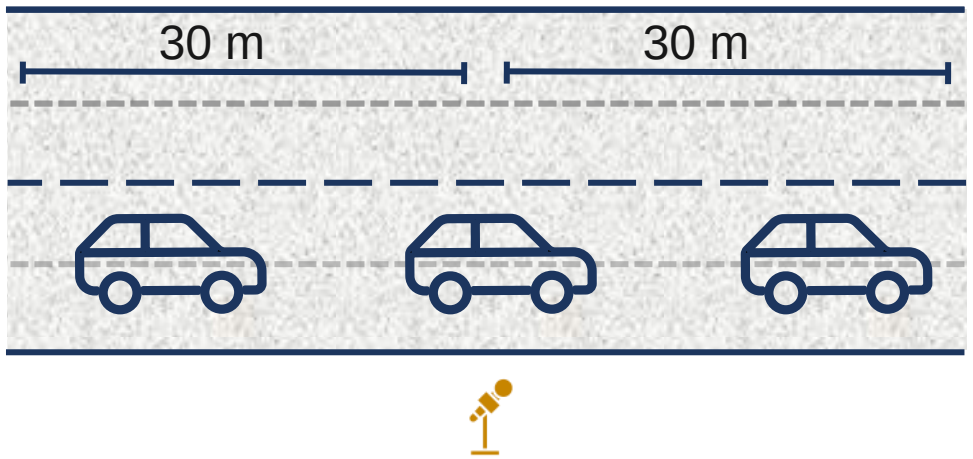
General information

- Measurements usually on public roads
- Measuring several vehicles passing by
- Speed for the measurements depends on the vehicle and the type of road
- Measurements on special test tracks
- Measuring one vehicle at a time
- Measurements are at $\mathbf{50}\ {}^{\mathbf{km}}/_{\mathbf{h}}$ reference speed

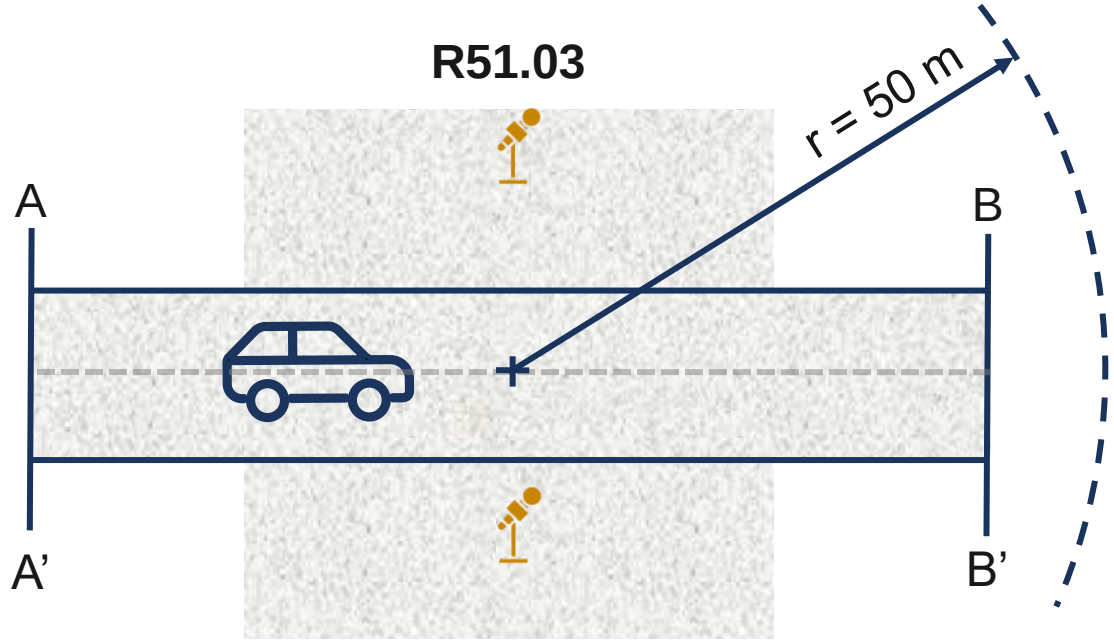
© fka GmbH

Possibilities for integrating sound emission changes
New coefficients from type approval data

SPB (ISO 11819-1)



R51.03



Road characteristics

- Specified road section ≥ 30m
  - Road must be mainly flat and straight (light turns/ gradients ≤ 2% negligible)
  - Surface in good condition, but not new
- Further requirements regarding free field conditions/no reflective objects
- No reflecting obstacles within 50 m
- Precisely defined road surface according to ISO 10844

© fka GmbH

Possibilities for integrating sound emission changes
New coefficients from type approval data

Speed

- Reference speeds **depending on type of road**:
  - **Low** speed: Ø 45 $^{km}/_{h}$ - 64 $^{km}/_{h}$
  - **Medium** speed: Ø 65 $^{km}/_{h}$ - 99 $^{km}/_{h}$
  - **High** speed: Ø > 100 $^{km}/_{h}$
- Vehicle speed to be measured approximately when the centre of the vehicle passes the microphone
- Reference speed is $\mathbf{50}\ ^{km}/_{h} \pm \mathbf{1}\ ^{km}/_{h}$
- Vehicle speed measurement accuracy:
  - Continuously operating measurement devices:
    - Accuracy at least $\pm$ 0,5 $^{km}/_{h}$
  - Independent measurement devices:
    - Accuracy at least $\pm$ 0,2 $^{km}/_{h}$

Vehi-cle cat.	Road 1: Low speed [$^{km}/_{h}$]	Road 2: Medium speed [$^{km}/_{h}$]	Road 3: High speed [$^{km}/_{h}$]
Cars	50	80	110
Trucks	50	80	80

New coefficients from type approval data

SPB (ISO 11819-1)	R51.03

Preliminary/additional calculations

- No additional calculations
- Vehicle specific PMR → a_{urban}, $a_{wot,ref}$

Measurements

Postprocessing

- L_{SPB} from measurements of several vehicles
- Temperature correction (ISO/TS 1347-2)
- Statistical pass by index (SPBI) can be calculated

$$\mathrm{SPBI} = 10\log[\mathrm{W_P} \times 10^{\frac{\mathrm{L_{SPB:P,v_{ref,P}}}}{10}} + \mathrm{W_H}\left(\frac{\mathrm{v_{ref,P}}}{\mathrm{v_{ref,H}}}\right) \times 10^{\frac{\mathrm{L_{SPB:H,v_{ref,H}}}}{10}}]$$

- Acceleration $a_{wot,i}$ (reached) → Gear selection
- Partial power factor k_p (& transmission factor k)
- Maximum SPL for constant driving $L_{crs,rep}$ and for WOT driving $L_{wot,rep}$
- Final sound pressure level for type approval

$$L_{urban} = L_{wot,rep} - \mathrm{k_p}\left(L_{wot,rep} - L_{crs,rep}\right)$$

Vehicle	Road 1		Road 2		Road 3	
	v_{ref} [km/h]	W	v_{ref} [km/h]	W	v_{ref} [km/h]	W
Cars (P)	50	0,9	80	0,8	110	0,7
Trucks (H)	50	0,1	80	0,2	80	0,3

* Note: For overview reasons it is referred to the respective standards regarding variable definition & abbreviations

Possibilities for integrating sound emission changes
New coefficients from type approval data

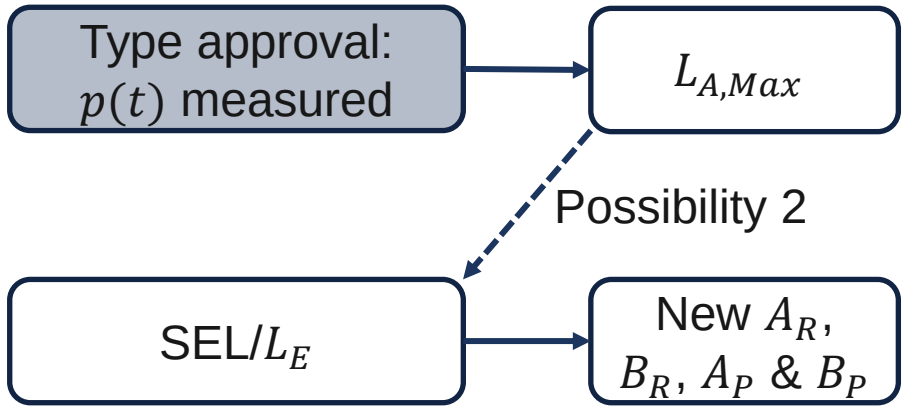
Possibility 2 – Background information

Derivation of conclusions about changes in SEL/L_E based on changes in $L_{A,max}$

- SILVIA project started 2002 with the aim to establish a European Guidance Manual on the "Utilisation of Low-Noise Road Surfaces"
  - The correlation (linear relation) between SEL/L_E and $L_{A,max}$ $(-10 \cdot \log v)$ has been investigated
    - For cat. 1 > 88 %
    - Based on [BEC01] measurements
- [ASC22]: "ROSANNE project found good correlation between [pass-by noise levels] and SEL"



Correlation: SEL/L_E and $L_{A,max} - 10 \cdot \log v$

Possibilities for integrating sound emission changes
New coefficients from TA data – Procedure – Overview

Motivation

- Aim: Update CNOSSOS coefficients using type approval measurements (TA)
- Procedure:
  1. ✓ Estimate calculation procedure to get SEL from TA
  2. Comprehend the CNOSSOS transfer functions (TFs) from point source (vehicle) to receiver (microphone)
  3. Rebuilding the TFs
  4. Identification of different conditions for TA compared to SPB reg. the TFs
  5. Adaption of the TFs (according to findings in 4.)
  6. Identification of different conditions for TA compared to SPB reg. the correction factors in CNOSSOS
  7. Estimation of coefficients for new vehicles

Transfer functions from L_W to SEL

[BLO17]

$$A_{atm} = \alpha_{atm} \cdot d/1\ 000 \qquad (2.5.13)$$

where

d is the direct 3D slant distance between the source and the receiver in m;

α_{atm} is the atmospheric attenuation coefficient in dB/km at the nominal centre frequency for each frequency band, in accordance with ISO 9613-1.

The values of the α_{atm} coefficient are given for a temperature of 15 °C, a relative humidity of 70 % and an atmospheric pressure of 101 325 Pa. They are calculated with the exact centre frequencies of the frequency band. These values comply with ISO 9613-1. Meteorological average over the long term shall be used if meteorological data is available.

[EUR15]

(h) Air temperature: 15 °C

Possibilities for integrating sound emission changes
New coefficients from TA data – Procedure – Step 3

Several issues arise

- Definition issue:
  - [PEE18]: “Transfer functions from LW to SEL”
    - It should be the transfer function from SEL to LW
- Final equation:
  - $L_W = SEL + 10\log\left(\frac{70}{3.6}\mathrm{m/s}\right) - 10\log(7.5\mathrm{m}) - 10\log\frac{160}{180}\pi + 10\log\left[4\pi\left((7.5\mathrm{m})^2 + (3\mathrm{m} - 0.05\mathrm{m})^2\right)\right] + \alpha_{atm} \cdot \frac{r_{atm}}{1000} - 3\mathrm{dB}$
  - $r_{atm} \geq \sqrt{d^2 + (h_r - h_s)^2} = 8.0593\mathrm{m}$
  - $r_{atm} \leq \sqrt{b^2 + (h_r - h_s)^2} = 43.2914\mathrm{m}$
    - with $b = \frac{d}{\cos\left(\frac{\alpha}{2}\right)} = 43.1908\mathrm{m}$

Transfer functions from L_W to SEL

Possibilities for integrating sound emission changes
New coefficients from TA data – Procedure – Step 3

Calculation of exact SPL over the time (→SEL)

» New approach: Estimation based on a hypothetical source with 10^{-12} W for each frequency band

1. $L_p(t,f) = L_w - 11 - 20 \cdot \log\left(r_{atm}(t)\right) - \alpha_{atm}(f) \cdot \frac{r_{atm}(t)}{1000} + \Delta L$

$= 10 \cdot \log\left(\frac{P}{P_0}\right) = 0$ dB
Constant over time and frequency

$= 10 \cdot \log(4\pi) = 11$ dB
Constant parameter

Depending considered track width, microphone position and vehicle speed

Frequency and time dependent atmospheric absorption

Assumed to be 3dB acc. to CNOSSOS

© fka GmbH

Possibilities for integrating sound emission changes
New coefficients from TA data – Procedure – Step 3

Calculation of exact SPL over the time (→SEL)

» New approach: Estimation based on a hypothetical source with 10^{-12} W for each frequency band

1. $L_p(t,f) = \quad L_w - 11 - 20 \cdot \log\left(r_{atm}(t)\right) - \alpha_{atm}(f) \cdot \frac{r_{atm}(t)}{1000} + \Delta L$

2. Relative sound pressure $\frac{p(t,f)}{p_0} = 10^{L_p(t,f)\cdot 0.1}$

3. $SEL(f) = 10 \cdot \log\left(sum\left(\frac{p(t,f)}{p_0}\right)\right) + 10 \cdot \log(\Delta t)$

4. For source power 10^{-12} W, the inverse SEL equals the transfer function

Vehicle sound source → Microphone

Possibilities for integrating sound emission changes
New coefficients from TA data – Procedure – Overview

Motivation

- Aim: Update CNOSSOS coefficients using type approval measurements (TA)
- Procedure:
  1. ✓ Estimate calculation procedure to get SEL from TA
  2. ✓ Comprehend the CNOSSOS transfer functions (TFs) from point source (vehicle) to receiver (microphone)
  3. ✓ Rebuilding the TFs
  4. Identification of different conditions for TA compared to SPB reg. the TFs
  5. Adaption of the TFs (according to findings in 4.)
  6. Identification of different conditions for TA compared to SPB reg. the correction factors in CNOSSOS
  7. Estimation of coefficients for new vehicles

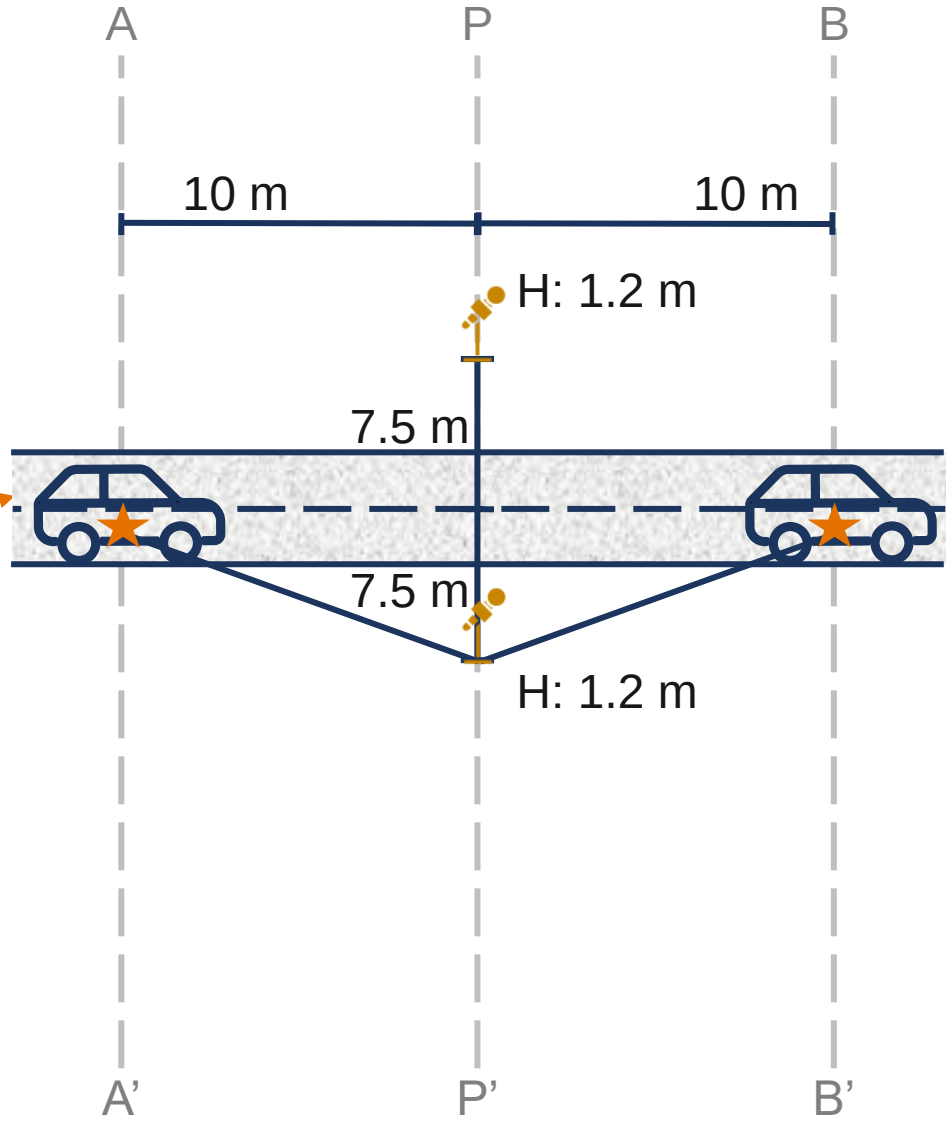
Possibilities for integrating sound emission changes
New coefficients from TA data – Procedure – Step 4

Required changes

- Microphone position
  - 1.2 m height instead of 3 m
- Reference vehicle speed
  - 50 km/h instead of 70 km/h
- Considered angle/track width
  - Before +/-80°, for TA narrower
- If required reference conditions (temperature, humidity)
  - Currently $T = 15°C$ & $h = 70\%$
- New: vehicle acceleration for trajectory calculation



© fka GmbH

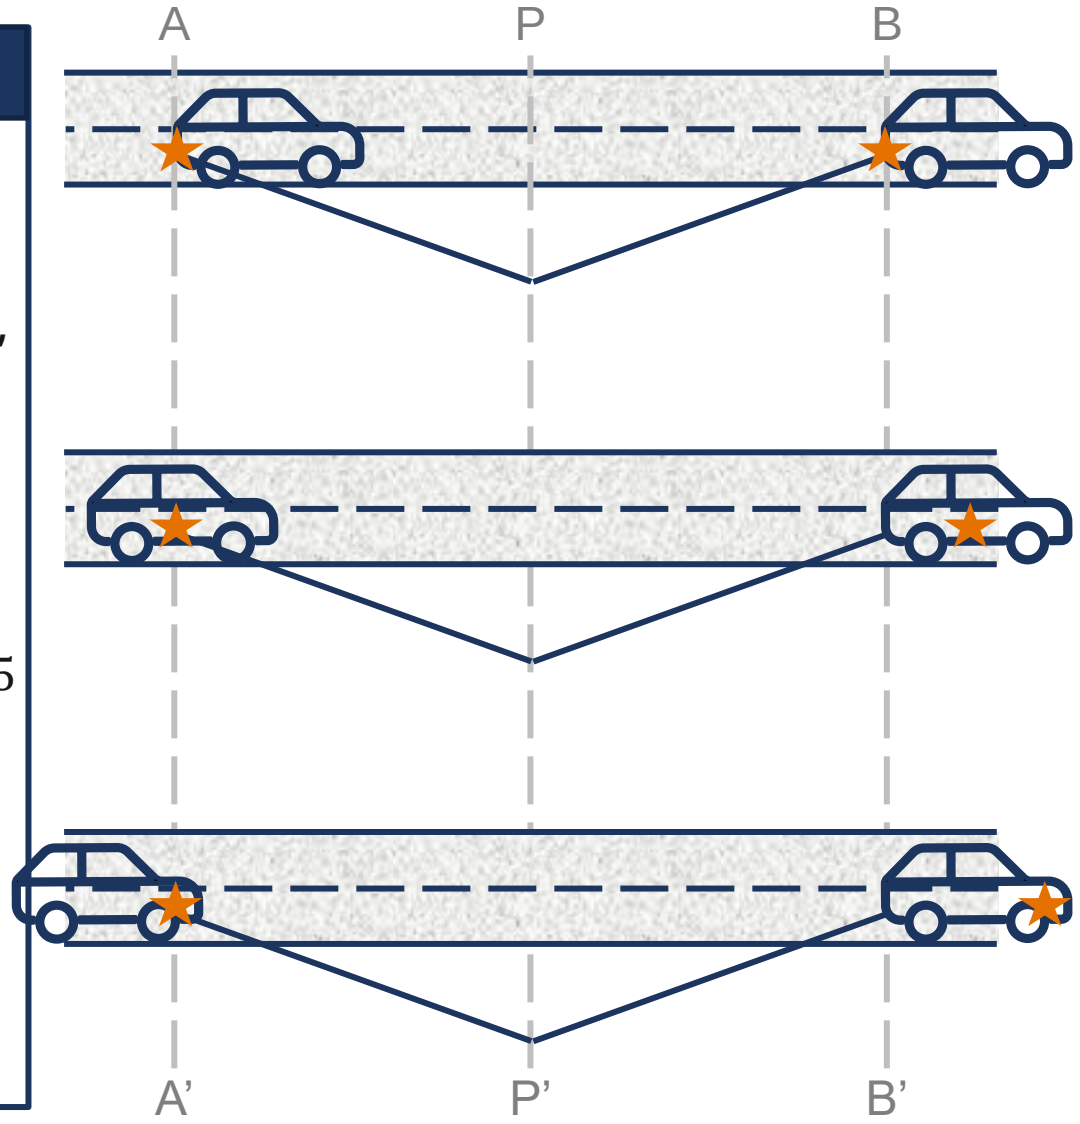
Possibilities for integrating sound emission changes
New coefficients from TA data – Procedure – Step 4

Which track width and position should be considered?

From R51.03

- "Calculation of acceleration":
  - "The speed either at AA′ or PP′ is defined as the vehicle speed when the reference point passes AA′ ($v_{AA'}$) or PP′ ($v_{PP'}$)."
  - "The speed at BB′ is defined when the rear of the vehicle passes BB′ ($v_{BB'}$). "
  - $a_{wot\ test} = \frac{\left(\left(\frac{v_{BB'}}{3.6}\right)^2 - \left(\frac{v_{AA'}}{3.6}\right)^2\right)}{2 \cdot (20 + l)}$

    Front engine: $l = l_{veh}$
    Mid engine: $l = l_{veh} \cdot 0.5$
    Rear engine: $l = 0$ m
  - It can be assumed that $l_{veh} = 5$ m



© fka GmbH

Possibilities for integrating sound emission changes
New coefficients from TA data – Procedure – Step 4

Which track width and position should be considered?

From R51.03

- “Interpretation of results”:
  - “[…] the maximum A-weighted sound pressure level indicated during each passage of the vehicle between the two lines AA′ and BB′ […]“
- Suggestion for front engine:
  - Usage of the calculated acceleration from $v_{BB'}$ and $v_{AA'}$
  - Track width to be considered: 25 m (symmetric)

New coefficients from TA data – Procedure – Step 6

Acceleration issue

- **No suitable acceleration correction defined in CNOSSOS directive, only for crossings**
  - If accelerated pass-by measurements are to be taken into account, a method must be defined
- **From CNOSSOS directive [EUR15] [EUR21b]**
  - $\Delta L_{WR,i,m} = \Delta L_{WR,road,i,m} + \Delta L_{WR,studdedtyres,i,m} + \Delta L_{WR,acc,i,m} + \Delta L_{W,temp}$
  - $\Delta L_{WP,i,m} = \Delta L_{WP,road,i,m} + \Delta L_{WP,grad,i,m} + \Delta L_{WP,acc,i,m}$

- $\Delta L_{WR,acc,i,m} = C_{R,m,k} \times Max\left(1 - \frac{|x|}{100}; 0\right)$
- $\Delta L_{WP,acc,i,m} = C_{P,m,k} \times Max\left(1 - \frac{|x|}{100}; 0\right)$

- $k = 1$ for crossings with traffic lights
- $k = 2$ for crossings with roundabouts

Table F-3

Coefficients $C_{R,m,k}$ and $C_{P,m,k}$ for acceleration and deceleration

Category	k	Cr	Cp
1	1 = crossing 2 = roundabout	– 4,5 – 4,4	5,5 3,1
2	1 = crossing 2 = roundabout	– 4 – 2,3	9 6,7
3	1 = crossing 2 = roundabout	– 4 – 2,3	9 6,7
4a	1 = crossing 2 = roundabout	0 0	0 0
4b	1 = crossing 2 = roundabout	0 0	0 0
5	1 = crossing 2 = roundabout

Road surface correction

- **Correction not available for TA road surface according to ISO 10844 [ISO21], only for:**
  - 1/2/3-layer ZOAB, SMA-NL5/8, brushed down concrete, […], quiet hard elements, thin layer A, thin layer B
- **Reference surface in CNOSSOS:**
  - An average of dense asphalt concrete 0/11 and stone mastic asphalt 0/11, between 2 and 7 years old and in a representative maintenance condition
- **From CNOSSOS directive [EUR15] [EUR21b]**
  - $\Delta L_{WR,i,m} = \Delta L_{WR,road,i,m} + \Delta L_{WR,studdedtyres,i,m} + \Delta L_{WR,acc,i,m} + \Delta L_{W,temp}$
  - $\Delta L_{WP,i,m} = \Delta L_{WP,road,i,m} + \Delta L_{WP,grad,i,m} + \Delta L_{WP,acc,i,m}$
  - $\Delta L_{WR,road,i,m} = \alpha_{i,m} + \beta_m \times \log\left(v/v_{ref}\right)$
  - $\Delta L_{WP,road,i,m} = \min\{\alpha_{i,m};0\}$

Coefficients $\alpha_{i,m}$ and β_m for road surface

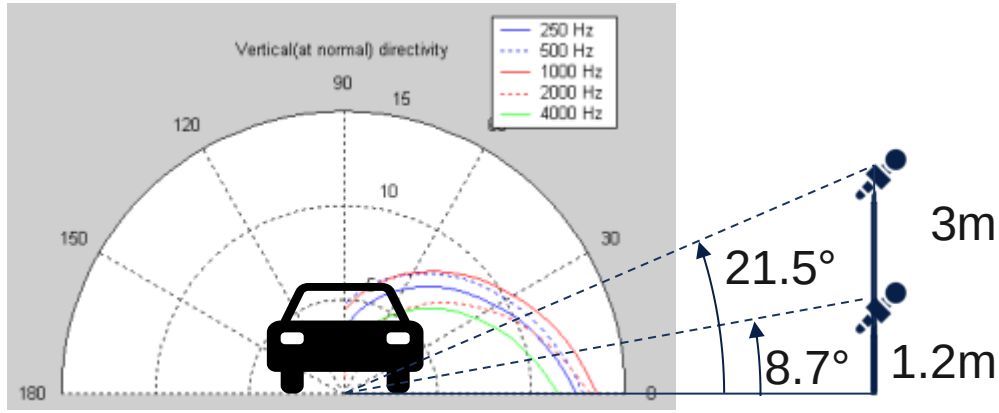
Road surface issue

- **Difference in microphone heights CNOSSOS vs TA**
  - This could lead to differences in the measured levels from vertical directivity
- **[JON04] regarding full vehicle (rolling & propulsion):**
  - „At present there is none [current official models regarding directivity] including complete directivity data“
  - Regarding the vertical directivity it is stated:
    - „The results show that there is little directivity in the vertical plane up to about 45º to the horizontal plane. After that the sound power level decreases up to about 5dB.“



[JON04]

Vertical directivity

- **Difference in microphone heights CNOSSOS vs TA**
  - This could lead to differences in the measured levels from vertical directivity
- **[JON04] regarding full vehicle (rolling & propulsion):**
  - „At present there is none [current official models regarding directivity] including complete directivity data“
  - Regarding the vertical directivity it is stated:
    - „The results show that there is little directivity in the vertical plane up to about 45° to the horizontal plane. After that the sound power level decreases up to about 5dB.“

- **The level ΔL difference for both microphone heights at 1kHz:**
  - $\Delta L_{1kHz} \approx 1.3\ \mathrm{dB}$
  - The directivity data indicates that the actual coefficients are even lower

Attentuation coefficient

- **From CNOSSOS directive [EUR15] based on ISO 9613-1 [ISO93]**
  - TFs and atmospheric absorption given for reference conditions ($T = 15°C$, $h_r = 70\%$, $p_r = 101.325\,\mathrm{kPa}$)
- **From [ISO93]**
  - Relaxation frequencies
    - Oxygen: $f_{rO} = \frac{p_a}{p_r}\left(24 + 4.04 \times 10^4 h \frac{0.02+h}{0.391+h}\right)$
    - Nitrogen: $f_{rN} = \frac{p_a}{p_r}\left(\frac{T}{T_0}\right)^{-1/2} \times \left(9 + 280h \exp\left\{-4.170\left[\left(\frac{T}{T_0}\right)^{-1/3} - 1\right]\right\}\right)$
  - Attenuation coefficient α
    - $\alpha = 8.686 f^2 \left(\left[1.84 \times 10^{-11}\left(\frac{p_a}{p_r}\right)^{-1}\left(\frac{T}{T_0}\right)^{-1/2}\right] + \left(\frac{T}{T_0}\right)^{-5/2} \times \left\{0.01275\left[\exp\left(-\frac{2239.1}{T}\right)\right]\left[f_{rO} + \frac{f^2}{f_{rO}}\right]^{-1} + 0.1068\left[\exp\left(-\frac{3352.0}{T}\right)\right]\left[f_{rN} + \frac{f^2}{f_{rN}}\right]^{-1}\right\}\right)$
  - Conversion of relative humidity h_r to molar concentration of water vapor h
    - $T_{01} = 0.01°C$ and $p_r = 101.325\mathrm{kPa}$
    - $C = -6.8246(T_{01}/T)^{1.261} + 4.6151$
    - $p_{sat} = p_r 10^C$
    - $h = h_r(p_{sat}/pr)/(p_a/pr)$

CNOSSOS:
Atmospheric absorption
$A_{atm} = \alpha \cdot d/1000$

Road surface temperature

- **From CNOSSOS directive [EUR15] [EUR21b]**
  - $\Delta L_{WR,i,m} = \Delta L_{WR,road,i,m} + \Delta L_{WR,studdedtyres,i,m} + \Delta L_{WR,acc,i,m} + \Delta L_{W,temp}$
  - It is explicitly mentioned, that the air temperature should be used, not the road surface temperature

  - With increasing temperature, the rolling noise gets quieter:
    - $\Delta L_{W,temp} = K_m \times (\tau_{ref} - \tau)$

    - $K_{m=1} = 0.08\ \mathrm{dB/°C}$

    - $K_{m=2} = K_{m=3} = 0.04\ \mathrm{dB/°C}$

    - $\tau_{ref} = 20°C$ (Side note: For atmospheric absorption A_{atm} in CNOSSOS, the reference temperature is 15°C)

Possibilities for integrating sound emission changes
New coefficients from TA data – Procedure – Overview

Motivation

- Aim: Update CNOSSOS coefficients using type approval measurements (TA)
- Procedure:
  1. ✓ Estimate calculation procedure to get SEL from TA
  2. ✓ Comprehend the CNOSSOS transfer functions (TFs) from point source (vehicle) to receiver (microphone)
  3. ✓ Rebuilding the TFs
  4. ✓ Identification of different conditions for TA compared to SPB reg. the TFs
  5. ✓ Adaption of the TFs (according to findings in 4.)
  6. ✓ Identification of different conditions for TA compared to SPB reg. the correction factors in CNOSSOS
  7. Estimation of coefficients for new vehicles

Agenda

- **Project plan**
- **Work Package 1 → Literature review**
  - WP 1.1: Analysis of current source description models (END & CNOSSOS-EU)
  - WP 1.2: Evaluation of noise mapping & management actions
- **Work Package 2 → Elaboration of correction factors**
  - WP 2.1: Analysis of existing source description methods
  - WP 2.2: Determination of source description accuracy
  - WP 2.3: Suitable adaptations of the source description
- **Summary**
- **Outlook**

© fka GmbH

Summary

- **CNOSSOS-EU** is a **method for calculating ambient noise** with the **goal of strategic noise mapping** and was first **introduced in 2015**
  - The noise source *vehicle* is described via **frequency-dependent sound power coefficients** for **rolling and propulsion noise** and the **vehicle speed**
    - **Basis** of the sound power coefficients are **comprehensive measurement campaigns up to 2006**

- **CNOSSOS-EU sound power coefficients were updated in 2021** to correct a previously made assumption

- Based on existing data, it has been shown that **vehicle noise has decreased** significantly, which is **not reflected in current** CNOSSOS-EU sound power **coefficients**

- **Deriving new coefficients for modern M1-vehicles would require an extensive SPB measurement campaign**

- A **procedure** has been developed and verified for calculating **new** CNOSSOS-EU sound power **coefficients from type approval data**

© fka GmbH

Agenda

- **Project plan**
- **Work Package 1 → Literature review**
  - WP 1.1: Analysis of current source description models (END & CNOSSOS-EU)
  - WP 1.2: Evaluation of noise mapping & management actions
- **Work Package 2 → Elaboration of correction factors**
  - WP 2.1: Analysis of existing source description methods
  - WP 2.2: Determination of source description accuracy
  - WP 2.3: Suitable adaptations of the source description
- **Summary**
- **Outlook**

© fka GmbH

Outlook

Recommended future working points for the derivation of new coefficients:

- **Investigation** of many and especially **different vehicles** as well as **different vehicle categories**
- **Integration** of a **precise surface correction**
- Further investigation on **technical changes in vehicle fleets** over time
  - Rolling vs. propulsion noise distribution
  - Frequency distribution
- Derivation of **national fleet coefficients**
- If required: **Inclusion of accelerated driving + investigation** on **acceleration correction**
